Solution (Murocoll-2)

10-0.3% (5): $16.99

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentThis form of phenylephrine will have no effect on dental treatment when given as eye drops.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsScopolamine and Phenylephrine

Phenylephrine and Zinc Sulfate

English

Jump To Field (Select Field Name)

Pronunciation(fen il EF rin & zingk SUL fate)

Canadian Brand NamesZincfrin速

Pharmacologic CategoryAdrenergic Agonist Agent

Use: Labeled IndicationsSoothe, moisturize, and remove redness due to minor eye irritation

Dosing: Adults **Ocular irritation:** Ophthalmic: Instill 1-2 drops in eye(s) 2-4 times/day as needed

Dosing: ElderlyRefer to adult dosing.

RestrictionsNot available in the U.S.

ContraindicationsHypersensitivity to phenylephrine, zinc sulfate, or any component of the formulation

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Quinolone Antibiotics: Zinc Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tetracycline Derivatives: Zinc Salts may decrease the absorption of Tetracycline Derivatives. Only a concern when both products are administered orally. **Exceptions:** Doxycycline. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Zinc Salts. Zinc Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Available in Canada

Solution, ophthalmic:

Zincfrin速 [CAN]: Phenylephrine 0.12% and zinc sulfate 0.25% (15 mL) [not available in the U.S.]

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Pronunciation(fen il EF rin, hye droe KOE done, & klor fen IR a meen)

U.S. Brand NamesB-Tuss™; Coughtuss; Cytuss HC; De-Chlor HC; DroTuss-CP; ED-TLC; ED-Tuss HC; Histinex® HC; Hydro PC II Plus; Hydro-PC II; Hydron CP; Maxi-Tuss HCX; Maxi-Tuss HC®; Mintuss HC; Mintuss MS; PolyTussin HD; Relacon-HC; Rindal HD Plus; Triant-HC™

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of cough and congestion associated with the common cold, sinusitis, or acute upper respiratory tract infections

Dosing: Adults**Cough and congestion:** Oral:

B-Tuss™: 5-10 mL every 6 hours (maximum: 40 mL/24 hours)

Histinex® HC, Cytuss HC: 10 mL every 4 hours (maximum: 40 mL/24 hours)

Maxi-Tuss HC®, Maxi-Tuss HCX: 5 mL every 4 hours (maximum: 30 mL/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cough and congestion:** Oral:

Children 2-6 years: *B-Tuss™:* 1.25-2.5 mL every 6 hours (maximum: 10 mL/24 hours)

Children 6-12 years:

B-Tuss™: 2.5-5 mL every 6 hours (maximum: 20 mL/24 hours)

Histinex® HC, Cytuss HC: 5 mL every 4 hours (maximum: 20 mL/24 hours)

Maxi-Tuss HC®, Maxi-Tuss HCX: 2.5 mL every 4 hours (maximum: 15 mL/24 hours)

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsC-III

ContraindicationsHypersensitivity to phenylephrine, hydrocodone, chlorpheniramine, codeine, sympathomimetic amines, antihistamines, or any component of the formulation; bronchial asthma, status asthmaticus; severe hypertension, severe coronary artery disease; MAO inhibitor therapy or within 14 days of therapy; narrow-angle glaucoma; urinary retention; peptic ulcer

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydromorphone, levorphanol, morphine, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Dosage form specific issues:

- Aspartame: Some products may contain aspartame.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsHydrocodone is excreted in breast milk; information for chlorpheniramine and phenylephrine is not available. The manufacturers recommend discontinuing the medication or to discontinue nursing during therapy.

Adverse ReactionsSee individual agents.

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Nursing: Physical Assessment/MonitoringSee individual agent for Phenylephrine.

Patient EducationSee individual agent for Phenylephrine. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid:

B-Tuss™: Phenylephrine hydrochloride 5 mg, hydrocodone bitartrate 5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, sugar free; candy apple flavor]

Coughtuss: Phenylephrine hydrochloride 5 mg, hydrocodone bitartrate 5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, sugar free; candy apple flavor]

De-Chlor HC: Phenylephrine hydrochloride 10 mg, hydrocodone bitartrate 2.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [cherry flavor]

DroTuss-CP: Phenylephrine hydrochloride 5 mg, hydrocodone bitartrate 5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, sugar free; candy apple flavor]

ED-Tuss HC: Phenylephrine hydrochloride 10 mg, hydrocodone bitartrate 3.5 mg, and chlorpheniramine maleate 4 mg per 5 mL (480 mL)

ED-TLC: Phenylephrine hydrochloride 5 mg, hydrocodone bitartrate 1.67 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL)

Hydron CP: Phenylephrine hydrochloride 10 mg, hydrocodone bitartrate 5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [pineapple-orange flavor]

Hydro PC II Plus: Phenylephrine hydrochloride 7.5 mg, hydrocodone bitartrate 3.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [strawberry flavor]

Maxi-Tuss HCX: Phenylephrine hydrochloride 12 mg, hydrocodone bitartrate 6 mg and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, sugar free; contains aspartame; vanilla bean flavor]

Relacon-HC: Phenylephrine hydrochloride 10 mg, hydrocodone bitartrate 3.5 mg, and chlorpheniramine maleate 2.5 mg per 5 mL (480 mL) [raspberry flavor]

Triant-HC™: Phenylephrine hydrocloride 5 mg, hydrocodone bitartrate 1.67 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, sugar free; strawberry flavor]

Syrup:

Cytuss HC: Phenylephrine hydrochloride 5 mg, hydrocodone bitartrate 2.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [peach flavor]

Histinex® HC: Phenylephrine hydrochloride 5 mg, hydrocodone bitartrate 2.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL, 960 mL) [alcohol free, sugar free; contains sodium benzoate]

Hydro-PC II: Phenylephrine hydrochloride 7.5 mg, hydrocodone bitartrate 2 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [strawberry flavor]

Maxi-Tuss HC®: Phenylephrine hydrochloride 10 mg, hydrocodone bitartrate 2.5 mg, and chlorpheniramine maleate 4 mg per 5 mL (480 mL) [orange flavor]

Mintuss HC: Phenylephrine hydrochloride 10 mg, hydrocodone bitartrate 2.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free; contains sodium benzoate; black cherry flavor]

Mintuss MS: Phenylephrine hydrochloride 10 mg, hydrocodone bitartrate 5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free; contains sodium benzoate; orange flavor]

PolyTussin HD: Phenylephrine hydrochloride 5 mg, hydrocodone bitartrate 6 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, sugar free]

Rindal HD Plus: Phenylephrine hydrochloride 7.5 mg, hydrocodone bitartrate 3.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, sugar free; contains sodium benzoate; black raspberry flavor]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Syrup (Hydro-PC II Plus)

7.5-2-3.5 mg/5 mL (473): $36.00

Mechanism of Action

Phenylephrine: Potent, direct-acting alpha-adrenergic stimulator with weak beta-adrenergic activity; causes vasoconstriction of the arterioles of the nasal mucosa and conjunctiva

Hydrocodone: Binds to opiate receptors in the CNS; suppresses cough in medullary center; produces generalized CNS depression

Chlorpheniramine: Competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Chlorpheniramine
- Phenylephrine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause anxiety, restlessness, and sedation; may rarely cause hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors; concurrent use with psychotropics may result in additive sedation; may result in loss of pain control if used with fluoxetine or paroxetine

Index Terms Chlorpheniramine, Phenylephrine, and Hydrocodone; Dihydrocodeine Bitartrate, Phenylephrine Hydrochloride, and Chlorpheniramine Maleate; Hydrocodone, Phenylephrine, and Chlorpheniramine; Phenylephrine Hydrochloride, Hydrocodone Bitartrate, and Chlorpheniramine Maleate

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Pronunciation(fen il EF rin, peer IL a meen, & deks troe meth OR fan)

U.S. Brand NamesAldex® DM; AllanVan-DM; Codal-DM [OTC]; codimal® DM [OTC]; Codituss DM [OTC]; MyHist-DM; Poly-Hist DM; Tannate-V-DM; Viravan®-DM

Pharmacologic CategoryAlpha/Beta Agonist; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of cough, nasal congestion, and discharge associated with the common cold, sinusitis, allergic rhinitis, and other respiratory tract conditions

Dosing: Adults **Relief of cough, congestion:** Oral:

codimal® DM: 10 mL every 4 hours; maximum: 60 mL/24 hours

Viravan®-DM: 5-10 mL of the suspension or 1-2 tablets every 12 hours

Dosing: Elderly Refer to adult dosing.

Dosing: Pediatric **Relief of cough, congestion:** Oral:

Children 2-6 years (Viravan®-DM): 2.5 mL of the suspension or $^{1}/_{2}$ tablet every 12 hours

Children 6-12 years:

- *codimal® DM:* 5 mL every 4 hours; maximum: 30 mL/24 hours
- *Viravan®-DM:* 5 mL of the suspension or $^{1}/_{2}$ to 1 tablet every 12 hours

Children >12 years: Refer to adult dosing.

Storage Store at controlled room temperature of 20°C to 25°C (68°F to 77°F).

Contraindications Hypersensitivity to phenylephrine, pyrilamine, dextromethorphan, or any component of the formulation; asthma; hypertension or peripheral vascular insufficiency; use with or within 14 days of MAO inhibitors; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; contraindicated in patients with hypertension.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in patients who are sedated, debilitated or confined to a supine position.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Use with caution in atopic children. Antihistamines may cause excitation in young children.

Other warnings/precautions:

- Self-medication (OTC use): When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever, rash, or persistent headache. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur.

Pregnancy Risk Factor C

Pregnancy Considerations Reproduction studies have not been conducted with this combination. Phenylephrine may cause fetal anoxia or bradycardia if administered late in pregnancy or during labor. Sympathomimetics may cause minor malformations when used during the first trimester.

Lactation Excretion in breast milk unknown/contraindicated

Breast-Feeding Considerations Specific information for phenylephrine or pyrilamine is not available, however, infants may be more sensitive to the effects of antihistamines.

Adverse Reactions Frequency not defined.

Cardiovascular: Arrhythmias, hyper-/hypotension, palpitation

Central nervous system: Coordination disturbances, drowsiness, dysphoria, euphoria, headache, insomnia, irritability, nervousness, sedation, seizure

Dermatologic: Photosensitivity, pruritus, rash, urticaria

Gastrointestinal: Constipation, diarrhea, epigastric discomfort, nausea, vomiting, xerostomia

Genitourinary: Difficult urination, urinary frequency

Hematologic: Agranulocytosis, hemolytic anemia, thrombocytopenia

Neuromuscular & skeletal: Tremor, weakness

Ocular: Visual disturbances

Respiratory: Shortness of breath, wheezing

Metabolism/Transport EffectsDextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringSee individual agent for Phenylephrine.

Patient EducationSee individual agent for Phenylephrine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid:

MyHist-DM: Phenylephrine hydrochloride 7.5 mg, pyrilamine maleate 12.5 mg, and dextromethorphan hydrochloride 15 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; grape flavor]

Suspension:

AllanVan-DM, Tannate-V-DM, Viravan®-DM: Phenylephrine tannate 12.5 mg, pyrilamine tannate 30 mg, and dextromethorphan tannate 25 mg per 5 mL (480 mL) [contains sodium benzoate; grape flavor]

Aldex® DM: Phenylephrine hydrochloride 5 mg, pyrilamine maleate 16 mg, and dextromethorphan hydrochloride 15 mg per 5 mL (480 mL) [contains tannic acid to provide a tannate suspension; contains sodium benzoate; grape flavor]

Syrup:

Codal-DM: Phenylephrine hydrochloride 5 mg, pyrilamine maleate 8.33 mg, and dextromethorphan hydrobromide 10 mg (480 mL) [cherry flavor] codimal® DM: Phenylephrine hydrochloride 5 mg, pyrilamine maleate 8.33 mg, and dextromethorphan hydrobromide 10 mg (120 mL, 480 mL) [alcohol free, dye free, sugar free; contains benzoic acid]

Codituss DM: Phenylephrine hydrochloride 5 mg, pyrilamine maleate 8.33 mg, and dextromethorphan hydrobromide 10 mg (120 mL, 480 mL) [alcohol free, dye free, sugar free; cherry punch flavor]

Poly Hist DM: Phenylephrine hydrochloride 7.5 mg, pyrilamine maleate 8.33 mg, and dextromethorphan hydrobromide 10 mg (480 mL) [alcohol free, dye free, sugar free; grape flavor]

Tablet, chewable [scored]:

Deconsal® DM: Phenylephrine hydrochloride 10 mg, pyrilamine maleate 16 mg, and dextromethorphan hydrobromide 15 mg [dye free; grape flavor]

Viravan®-DM: Phenylephrine tannate 25 mg, pyrilamine tannate 30 mg, and dextromethorphan tannate 25 mg [dye free; grape flavor]

Generic AvailableYes: Excludes chewable tablet

Pricing: U.S. (www.drugstore.com)

Syrup (Codal-DM)

5-8.33-10 mg/5 mL (120): $7.99

Mechanism of Action

Phenylephrine hydrochloride is a sympathomimetic agent (primarily alpha), decongestant.

Pyrilamine is an H_1-receptor antagonist.

Dextromethorphan, a non-narcotic antitussive, increases cough threshold by its activity on the medulla oblongata.

Related Information

- Dextromethorphan
- Phenylephrine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusSedation is common; may cause anxiety, excitability, dysphoria, euphoria, insomnia, nervousness, fatigue, or depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors. Concurrent use with psychotropic agents may result in additive sedative and/or anticholinergic effects; monitor. May cause seizures; monitor in patients receiving clozapine. May rarely be associated with agranulocytosis; use caution with clozapine, carbamazepine, and mirtazapine. May cause thrombocytopenia; monitor in patients receiving valproic acid.

Index TermsDextromethorphan Tannate, Pyrilamine Tannate, and Phenylephrine Tannate; Pyrilamine Maleate, Dextromethorphan Hydrobromide, and Phenylephrine Hydrochloride

---

Pronunciation(fen il EF rin, peer IL a meen, & gwye FEN e sin)
U.S. Brand NamesRyna-12X®
Pharmacologic CategoryAlpha/Beta Agonist; Decongestant; Expectorant; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation
Use: Labeled IndicationsSymptomatic relief of cough, nasal congestion, and discharge associated with the common cold, sinusitis, allergic rhinitis, and other respiratory tract conditions
Dosing: Adults

Relief of cough, congestion: Oral: 1-2 tablets every 12 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Relief of cough, congestion: Oral:

Children 2-6 years: 2.5-5 mL of the suspension every 12 hours

Children 6-11 years: 5-10 mL of the suspension **or** $^1/_2$ to 1 tablet every 12 hours

Children ≥12 years: Refer to adult dosing.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to phenylephrine, pyrilamine, guaifenesin, or any component of the formulation; severe hypertension or coronary artery disease; use with or within 14 days of MAO inhibitors
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; contraindicated in patients with severe hypertension or coronary artery disease..
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or narrow-angle glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in patients who are sedated, debilitated or confined to a supine position.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Other warnings/precautions:

- Cough control: Use with caution in patients with chronic or persistent coughs due to asthma, emphysema, smoking, or cough accompanied by excessive secretions.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Phenylephrine may cause fetal anoxia or bradycardia if administered late in pregnancy or during labor. Sympathomimetics may cause minor malformations when used during the first trimester.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsSpecific information for phenylephrine or pyrilamine is not available, however, infants may be more sensitive to the effects of antihistamines.

Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness (rare), drowsiness, headache, nervousness, restlessness, sedation

Dermatologic: Rash (rare), urticaria (rare)

Gastrointestinal: Dry mucous membranes, nausea, vomiting

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Test InteractionsGuaifenesin: Possible color interference with determination of 5-HIAA and VMA; discontinue for 48 hours prior to test
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension:

Ryna-12X®: Phenylephrine tannate 5 mg, pyrilamine tannate 30 mg, and guaifenesin 100 mg per 5 mL (120 mL) [contains benzoic acid; grape flavor]

Tablet [scored]:

Ryna-12X®: Phenylephrine tannate 25 mg, pyrilamine tannate 60 mg, and guaifenesin 200 mg

Generic AvailableNo
Mechanism of Action

Phenylephrine is a sympathomimetic agent (primarily alpha), decongestant.

Pyrilamine is an H_1-receptor antagonist.

Guaifenesin is an expectorant.

Related Information

- GuaiFENesin
- Phenylephrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Pyrilamine: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Phenylephrine: Up to 10% of patients could experience tachycardia, palpitations, and xerostomia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine or mepivacaine and levonordefrin (Carbocaine® 2% with Neo-Cobefrin®) to cause a pressor response.
Mental Health: Effects on Mental StatusMay cause sedation, nervousness, restlessness, or dizziness
Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment. May cause CNS depression, concurrent use with psychotropics may produce additive effects.
Index TermsGuaifenesin, Pyrilamine Tannate, and Phenylephrine Tannate; Pyrilamine Tannate, Guaifenesin, and Phenylephrine Tannate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#cough

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Medication Safety Issues

Sound-alike/look-alike issues:

Mydfrin® may be confused with Midrin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(fen il EF rin)

U.S. Brand Names4 Way® Fast Acting [OTC]; 4 Way® Menthol [OTC]; 4 Way® No Drip [OTC]; AK-Dilate®; Altafrin; Anu-Med [OTC]; Dimetapp® Toddler's [OTC]; Formulation R™ [OTC]; Little Noses® Decongestant [OTC]; LuSonal™; Medi-Phenyl [OTC]; Medicone® Suppositories [OTC]; Mydfrin®; Nasop12™; Neo-Synephrine® Extra Strength [OTC]; Neo-Synephrine® Injection; Neo-Synephrine® Mild [OTC]; Neo-Synephrine® Regular Strength [OTC]; Neofrin™; NāSop™ [DSC]; OcuNefrin™ [OTC]; Preparation H® [OTC]; Rectacaine [OTC]; Relief® [OTC] [DSC]; Rhinall [OTC]; Sudafed PE™ [OTC]; Triaminic® Infant Thin Strips® Decongestant [OTC] [DSC]; Triaminic® Thin Strips® Cold [OTC]; Tronolane® Suppository [OTC]; Tur-bi-kal® [OTC]; Vicks® Sinex® Nasal Spray [OTC]; Vicks® Sinex® UltraFine Mist [OTC]

Canadian Brand NamesDionephrine®; Mydfrin®; Neo-Synephrine®

Pharmacologic CategoryAlpha/Beta Agonist; Ophthalmic Agent, Antiglaucoma; Ophthalmic Agent, Mydriatic

Use: Labeled IndicationsTreatment of hypotension, vascular failure in shock; as a vasoconstrictor in regional analgesia; as a mydriatic in ophthalmic procedures and treatment of wide-angle glaucoma; supraventricular tachycardia

For OTC use as symptomatic relief of nasal and nasopharyngeal mucosal congestion, treatment of hemorrhoids, relief of redness of the eye due to irritation

Dosing: Adults

Hemorrhoids: Rectal:

Cream/ointment: Apply to clean dry area, up to 4 times/day; may be used externally or inserted rectally using applicator.

Suppository: Insert 1 suppository rectally, up to 4 times/day

Hypotension/shock:

I.V. bolus: 0.1-0.5 mg/dose every 10-15 minutes as needed (initial dose should not exceed 0.5 mg)

I.V. infusion: Initial dose: 100-180 mcg/minute; when blood pressure is stabilized, maintenance rate: 40-60 mcg/minute; rates up to 360 mcg/minute have been reported; dosing range: 0.4-9.1 mcg/kg/minute

Nasal congestion:

Intranasal: Instill 1-2 sprays or instill 1-2 drops every 4 hours of 0.25% to 0.5% solution as needed; 1% solution may be used in adult in cases of extreme nasal congestion; do not use nasal solutions more than 3 days

Oral:

Hydrochloride salt: 10-20 mg every 4 hours

Tannate salt:

NāSop™ suspension: 7.5-15 mg every 12 hours

Nasop12™ chewable tablet: 1-2 tablets (10-20 mg) every 12 hours

Ocular procedures:*Ophthalmic:* Instill 1 drop of 2.5% or 10% solution, may repeat in 10-60 minutes as needed.

Paroxysmal supraventricular tachycardia:*I.V.:* 0.25-0.5 mg/dose over 20-30 seconds

Reduction in ocular redness (OTC formulation):*Ophthalmic:* Instill 1-2 drops 0.12% solution into affected eye, up to 4 times/day; do not use for >72 hours

Dosing: Elderly

Nasal decongestant: Administer 2-3 drops or 1-2 sprays every 4 hours of 0.125% to 0.25% solution as needed; do not use more than 3 days.

Ophthalmic preparations for pupil dilation: Instill 1 drop of 2.5% solution, may repeat in 1 hour if necessary.

Refer to adult dosing for other uses and Geriatric Considerations for cautions on I.V. use.

Dosing: Pediatric

Hemorrhoids: Children >12 years: Refer to adult dosing.

Hypotension/shock: Children:

I.V. bolus: 5-20 mcg/kg/dose every 10-15 minutes as needed

I.V. infusion: 0.1-0.5 mcg/kg/minute

Nasal congestion:

2-6 years:

Intranasal: Instill 1 drop every 2-4 hours of 0.125% solution as needed. (**Note:** Therapy should not exceed 3 continuous days.)

Oral: Tannate salt (NāSop™ suspension): 1.87-3.75 mg every 12 hours

6-12 years:

Intranasal: Instill 1-2 sprays or instill 1-2 drops every 4 hours of 0.25% solution as needed. (**Note:** Therapy should not exceed 3 continuous days.)

Oral:

Hydrochloride salt: 10 mg every 4 hours

Tannate salt:

NāSop™ suspension: 3.75-7.5 mg every 12 hours

Nasop12™ chewable tablet: $^1/_2$ to 1 tablet (5-10 mg) every 12 hours

>12 years: Refer to adult dosing.

Ocular procedures: Ophthalmic:

Infants <1 year: Instill 1 drop of 2.5% 15-30 minutes before procedures

Children: Refer to adult dosing.

Paroxysmal supraventricular tachycardia: I.V.: Children: 5-10 mcg/kg/dose over 20-30 seconds

Calculations

- Phenylephrine
- Phenylephrine, Weight-Based

Administration: I.V. DetailMay cause necrosis or sloughing tissue if extravasation occurs during I.V. administration or SubQ administration.

Extravasation management: Use phentolamine as antidote; mix 5 mg with 9 mL of NS. Inject a small amount of this dilution subcutaneously into extravasated area. Blanching should reverse immediately. Monitor site. If blanching should recur, additional injections of phentolamine may be needed.

pH: 3.0-6.5

Administration: OralChewable tablet: Chew or crush well. May mix crushed tablet with food. Do not swallow whole.

Dietary ConsiderationsNāSop™ contains phenylalanine 4 mg/tablet. LuSonal™ contains phenylalanine. Sudafed PE™ contains phenylalanine 1 mg/strip.

Storage

Solution for injection: Store vials at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light. Do not use solution if brown or contains a precipitate.

Ophthalmic solution:

0.12%: Store at controlled room temperature. Protect from light and excessive heat.

2.5% and 10%: Refer to product labeling. Some products are labeled to store at room temperature, others should be stored under refrigeration at 2˚C to 8˚C (36˚F to 46˚F). Do not use solution if brown or contains a precipitate.

Tablet, chewable: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

ReconstitutionSolution for injection:

I.V. infusion: May dilute 10 mg in 500 mL NS or D_5W.

I.V. injection: Dilute with SWFI to a concentration of 1 mg/mL.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, $^1/_2NS$, NS, sodium bicarbonate 5%.

Y-site administration: Compatible: Amiodarone, cisatracurium, etomidate, famotidine, haloperidol, inamrinone, levofloxacin, remifentanil, zidovudine. **Incompatible:** Thiopental. **Variable (consult detailed reference):** Propofol.

Compatibility when admixed: Compatible: Chloramphenicol, chloramphenicol with sodium bicarbonate, dobutamine, lidocaine, potassium chloride, sodium bicarbonate.

ContraindicationsHypersensitivity to phenylephrine or any component of the formulation; hypertension; ventricular tachycardia

Oral: Use with or within 14 days of MAO inhibitor therapy

Nasop12™: Additional contraindications: Use in newborns; breast-feeding

Ophthalmic: Narrow-angle glaucoma

Warnings/Precautions

Boxed warnings:

- Trained personnel: See "Other warnings/precautions" below.

Concurrent drug therapy issues:

- Monoamine oxidase inhibitors (MAO-I): Use with extreme caution in patients taking MAO inhibitors; hypertension may result from concurrent use.

Dosage form specific issues:

- Intravenous: Use with caution in the elderly, patients with hyperthyroidism, bradycardia, partial heart block, myocardial disease, or severe CAD. Assure adequate circulatory volume to minimize need for vasoconstrictors. Avoid hypertension; monitor blood pressure closely and adjust infusion rate. Avoid extravasation; infuse into a large vein if possible. Avoid infusion into leg veins. Watch I.V. site closely. If extravasation occurs, infiltrate the area subcutaneously with diluted phentolamine (5-10 mg in 10-15 mL of saline) with a fine hypodermic needle. Phentolamine should be administered as soon as possible after extravasation is noted.

- Nasal: Use with caution in patients with hyperthyroidism, diabetes mellitus, cardiovascular disease, ischemic heart disease, increased intraocular pressure, prostatic hyperplasia or in the elderly. Rebound congestion may occur when nasal products are discontinued after chronic use. When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 3 days.

- Ophthalmic: When used for self-medication (OTC), notify healthcare provider in case of vision changes, continued redness, or if symptoms worsen or do not improve within 3 days.

- Oral: Use with caution in patients with asthma, bowel obstruction/narrowing, hyperthyroidism, diabetes mellitus, cardiovascular disease, ischemic heart disease, increased intraocular pressure, prostatic hyperplasia or in the elderly. When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur. Not for OTC use in children <2 years of age.

- Rectal: Use with caution in patients with hyperthyroidism, diabetes mellitus, cardiovascular disease, ischemic heart disease, increased intraocular pressure, prostatic hyperplasia or in the elderly. When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or if bleeding occurs.

- Sulfites: Some products contain sulfites which may cause allergic reactions in susceptible individuals.

Other warnings/precautions:

- Trained personnel: **[U.S. Boxed Warning]: Intravenous preparations should be administered by adequately trained individuals familiar with its use.**

Geriatric ConsiderationsElderly are more predisposed to the adverse effects of sympathomimetics since they frequently have cardiovascular disease and diabetes mellitus, and are on multiple medications. Since oral and topical phenylephrine can be obtained OTC, elderly patients should be counseled about their proper use and in what disease states they should be avoided. Phenylephrine I.V. should be used with extreme caution in the elderly. The 10% ophthalmic solution has caused increased blood pressure in elderly patients and its use should, therefore, be avoided.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia (rare), decreased cardiac output, hypertension, pallor, precordial pain or discomfort, reflex bradycardia, severe peripheral and visceral vasoconstriction

Central nervous system: Anxiety, dizziness, excitability, giddiness, headache, insomnia, nervousness, restlessness

Endocrine & metabolic: Metabolic acidosis

Gastrointestinal: Gastric irritation, nausea

Local: I.V.: Extravasation which may lead to necrosis and sloughing of surrounding tissue, blanching of skin

Neuromuscular & skeletal: Paresthesia, pilomotor response, tremor, weakness

Renal: Decreased renal perfusion, reduced urine output

Respiratory: Respiratory distress

Miscellaneous: Hypersensitivity reactions (including rash, urticaria, leukopenia, agranulocytosis, thrombocytopenia)

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid ephedra, yohimbe (may cause CNS stimulation).
Monitoring ParametersBlood pressure, pulse; excitability, irritability, anxiety

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions according to use. **Parenteral:** Monitor arterial blood gases, vital signs, adverse reactions, and infusion site. **Nasal/ophthalmic:** Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. Systemic absorption from ophthalmic instillation is minimal.

Patient Education

Nasal decongestant: Do not use for more than 3 days in a row. Clear nose as much as possible before use. Tilt head back and instill recommended dose of drops or spray. Do not blow nose for 5-10 minutes. You may experience transient stinging or burning.

Ophthalmic: Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Open eye, look at ceiling, and instill prescribed amount of solution. Close eye and roll eye in all directions, and apply gentle pressure to inner corner of eye for 1-2 minutes after instillation. Temporary stinging or blurred vision may occur. Report persistent pain, burning, double vision, severe headache, or if condition worsens.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, rectal, as hydrochloride:

- Formulation R™: 0.25% (54 g) [contains sodium benzoate]

Filmstrip, orally disintegrating, as hydrochloride:

- Sudafed PE™: 10 mg (5s, 10s) [contains phenylalanine 1 mg/strip; cherry menthol flavor]
- Triaminic® Infant Thin Strips® Decongestant: 1.25 mg [mixed berry flavor] [DSC]
- Triaminic® Thin Strips® Cold: 2.5 mg [raspberry flavor]

Injection, solution, as hydrochloride: 1% [10 mg/mL] (1 mL, 5 mL, 10 mL) [may contain sodium metabisulfite]

- Neo-Synephrine®: 1% (1 mL) [contains sodium metabisulfite]

Liquid, oral, as hydrochloride:

- LuSonal™: 7.5 mg/5 mL (480 mL) [contains phenylalanine; strawberry flavor]

Liquid, oral, as hydrochloride [drops]:

- Dimetapp® Toddler's: 1.25 mg/0.8 mL (15 mL) [alcohol free; contains sodium benzoate; grape flavor]

Ointment, rectal, as hydrochloride:

- Formulation R™, Preparation H®: 0.25% (30 g, 60 g) [contains benzoic acid]
- Rectacaine: 0.25% (30 g)

Solution, intranasal, as hydrochloride [drops]:

- Little Noses® Decongestant: 0.125% (15 mL) [contains benzalkonium chloride]
- Neo-Synephrine® Extra Strength: 1% (15 mL) [contains benzalkonium chloride]
- Neo-Synephrine® Regular Strength: 0.5% (15 mL) [contains benzalkonium chloride]
- Rhinall: 0.25% (30 mL) [contains benzalkonium chloride and sodium bisulfite]
- Tur-bi-kal®: 0.17% (30 mL) [contains benzalkonium chloride]

- Rhinall: 0.25% (40 mL) [contains benzalkonium chloride and sodium bisulfite]
- Vicks® Sinex®, Vicks® Sinex® UltraFine Mist: 0.5% (15 mL) [contains benzalkonium chloride]

Solution, ophthalmic, as hydrochloride: 2.5% (2 mL, 3 mL, 5 mL, 15 mL) [may contain sodium bisulfite]

- AK-Dilate®: 2.5% (2 mL, 15 mL); 10% (5 mL) [contains benzyl alcohol]

Altrafrin: 0.12% (15 mL) [OTC]; 2.5% (15 mL) [RX; contains benzalkonium chloride]; 10% (5 mL) [RX; contains benzalkonium chloride]

Mydfrin®: 2.5% (3 mL, 5 mL) [contains sodium bisulfite]

Neofrin™: 2.5% (15 mL); 10% (15 mL)

OcuNefrin™: 0.12% (15 mL)

Relief®: 0.12% (15 mL) [contains benzalkonium chloride] [DSC]

Suppository, rectal, as hydrochloride: 0.25% (12s)

Anu-Med: 0.25% (12s)

Formulation R™, Preparation H®: 0.25% (12s, 24s, 48s)

Medicone®, Tronolane®: 0.25% (12s, 24s)

Rectacaine: 0.25% (12s)

Suspension, oral, as tannate:

NāSop™: 7.5 mg/5 mL (120 mL) [orange flavor] [DSC]

Tablet, chewable, as tannate:

Nasop12™: 10 mg [grape flavor]

Tablet, as hydrochloride: 10 mg

Medi-Phenyl: 5 mg

Sudafed PE™: 10 mg

Tablet, orally dissolving, as hydrochloride:

NāSop™: 10 mg [contains phenylalanine 4 mg/tablet; bubble gum flavor] [DSC]

Generic AvailableYes: Excludes chewable tablet, cream, filmstrip, liquid, suspension

Pricing: U.S. (www.drugstore.com)

Solution (Mydfrin)

2.5% (5): $33.57

Solution (Neo-Synephrine)

2.5% (15): $35.99

Mechanism of ActionPotent, direct-acting alpha-adrenergic stimulator with weak beta-adrenergic activity; causes vasoconstriction of the arterioles of the nasal mucosa and conjunctiva; activates the dilator muscle of the pupil to cause contraction; produces vasoconstriction of arterioles in the body; produces systemic arterial vasoconstriction

Pharmacodynamics/Kinetics

Onset of action: I.M., SubQ: 10-15 minutes; I.V.: Immediate; Ophthalmic: 10-15 minutes

Duration: I.M.: 0.5-2 hours; I.V.: 15-30 minutes; SubQ: 1 hour; Ophthalmic: Maximal mydriasis: 1 hour, recover time: 3-6 hours

Metabolism: Hepatic, via intestinal monoamine oxidase to phenolic conjugates

Excretion: Urine (90%)

Related Information

- Hemodynamic Support, Intravenous

Pharmacotherapy PearlsPhenylephrine allows for close titration of blood pressure and should be used in patients with hypotension or shock due to peripheral vasodilation. Phenylephrine should not constitute sole therapy in patients with hypotension due to aortic dysfunction or hypovolemia. An important benefit of this drug is the short half-life, allowing rapid changes in dosage with prompt appropriate blood pressure responses. When administered intravenously, it should be used in intensive care settings or under very close monitoring.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tachycardia, palpitations (use vasoconstrictor with caution), and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause anxiety or restlessness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors may result in hypertensive crisis; avoid combination

Cardiovascular Considerations

Hypotension in Patients With Hypertrophic Obstructive Cardiomyopathy (HOCM): Phenylephrine is the vasopressor of choice in these patients. Phenylephrine is a pure alpha$_1$ agonist that will cause vasoconstriction without increasing heart rate and contractility. This is advantageous in patients with HOCM because increases in both heart rate and contractility may cause the obstruction to become worse, leading to a decrease in cardiac output. Other vasopressors like dopamine, epinephrine, and norepinephrine may increase contractility and/or heart rate.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Phenylephrine allows for close titration of blood pressure and may be used in patients with hypotension or shock due to peripheral vasodilation; can increase blood pressure in fluid-resuscitated septic shock patients; does not impair cardiac or renal function. May be a good choice when tachyarrhythmias limit use of other vasopressors, although experience in patients with septic shock is limited. An increase in oxygen delivery and consumption may occur in >15% of patients according to one study (Flancbaum, 1997).

Extravasation Management: Antidote for peripheral ischemia caused by phenylephrine extravasation: To prevent sloughing and necrosis in ischemic areas, the area should be infiltrated as soon as possible with 5-10 mg of Regitine® (phentolamine), an adrenergic blocking agent, diluted in 10-15 mL of saline. A syringe with a fine hypodermic needle should be used, and the solution liberally infiltrated throughout the ischemic area. Sympathetic blockade with phentolamine causes immediate and conspicuous local hyperemic changes if the area is infiltrated within 12 hours. Therefore, phentolamine should be given as soon as possible after the extravasation is noted, as phentolamine may be ineffective if given >12 hours after extravasation.

Index TermsPhenylephrine Hydrochloride; Phenylephrine Tannate

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Phenytoin and Fosphenytoin: Genetic Susceptibility to Serious Skin Reactions - November 2008

The U.S. Food and Drug Administration (FDA) is notifying healthcare professionals of preliminary information concerning the potential for serious skin reactions in susceptible patients treated with phenytoin (or fosphenytoin). Data suggests that patients testing positive for the human leukocyte antigen (HLA) allele *HLA-B*1502* have an increased risk of developing Stevens-Johnson syndrome (SJS) and/or toxic epidermal necrolysis (TEN). The risk appears to be highest in the early months of therapy initiation. The presence of this genetic variant exists in up to 15% of people of Asian descent in China, Thailand, Malaysia, Indonesia, Taiwan, and the Philippines, and may vary from <1% in Japanese and Koreans, to 2% to 4% of South Asians and Indians. This variant is virtually absent in those of Caucasian, African-American, Hispanic, or European ancestry. Of note, carbamazepine, another antiepileptic with a chemical structure similar to phenytoin, updated its prescribing information (December 2007) to include a warning of an increased risk of SJS and TEN in patients carrying the *HLA-B*1502* allele and a recommendation to screen patients of Asian descent for the allele prior to initiating therapy. In contrast to carbamazepine, the FDA is not recommending testing for the presence of *HLA-B*1502* prior to initiating phenytoin therapy until more information is available. In the interim, the FDA is advising that prescribers avoid phenytoin or fosphenytoin as alternatives to carbamazepine therapy in patients positive for *HLA-B*1502*.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Phenytoin

Medication Safety Issues

Sound-alike/look-alike issues:

Phenytoin may be confused with phenelzine, phentermine

Dilantin® may be confused with Dilaudid®, diltiazem, Dipentum®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

International issues:

Dilantin® may be confused with Dolantine® which is a brand name for pethidine in Belgium and Switzerland

Pronunciation(FEN i toyn)

U.S. Brand Names Dilantin®; Phenytek®

Canadian Brand Names Dilantin®

Pharmacologic Category Antiarrhythmic Agent, Class Ib; Anticonvulsant, Hydantoin

Use: Labeled Indications Management of generalized tonic-clonic (grand mal), complex partial seizures; prevention of seizures following head trauma/neurosurgery

Dosing: Adults

Status epilepticus: I.V.: Loading dose: Manufacturer recommends 10-15 mg/kg, however, 15-20 mg/kg is generally recommended; maximum rate: 50 mg/minute

Anticonvulsant: Oral: Loading dose: 15-20 mg/kg; based on phenytoin serum concentrations and recent dosing history; administer oral loading dose in 3 divided doses given every 2-4 hours to decrease GI adverse effects and to ensure complete oral absorption; maintenance dose: 300 mg/day or 5-6 mg/kg/day in 3 divided doses or 1-2 divided doses using extended release (range 200-1200 mg/day)

Dosage adjustment in obesity: Loading dose: Use adjusted body weight (ABW) (Abernethy, 1985)

ABW = [(Actual body weight – IBW) x 1.33] + IBW

Maximum loading dose: 2000 mg (Erstad, 2004)

Maintenance doses should be based on ideal body weight, conventional daily doses with adjustments based upon therapeutic drug monitoring and clinical effectiveness. (Abernethy, 1985; Erstad, 2002; Erstad, 2004)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Status epilepticus: I.V.:

Infants and Children: Loading dose: 15-20 mg/kg in a single or divided dose; maintenance dose: Initial: 5 mg/kg/day in 2 divided doses, usual doses:

6 months to 3 years: 8-10 mg/kg/day

4-6 years: 7.5-9 mg/kg/day

7-9 years: 7-8 mg/kg/day

10-16 years: 6-7 mg/kg/day, some patients may require every 8 hours dosing

Anticonvulsant: Children: Oral: Refer to adult dosing.

Dosing: Renal ImpairmentPhenytoin level in serum may be difficult to interpret in renal failure. Monitoring of free (unbound) concentrations or adjustment to allow interpretation is recommended.

Dosing: Hepatic ImpairmentSafe in usual doses in mild liver disease; clearance may be substantially reduced in cirrhosis and plasma level monitoring with dose adjustment advisable. Free phenytoin levels should be monitored closely.

Calculations

- Phenytoin, Corrected Serum

Administration: I.M.Although approved for I.M. use, I.M. administration is not recommended due to erratic absorption and pain on injection. Fosphenytoin may be considered.

Administration: I.V.Vesicant. Fosphenytoin may be considered for loading in patients who are in status epilepticus, hemodynamically unstable or develop hypotension/bradycardia with I.V. administration of phenytoin. Phenytoin may be administered by IVP or IVPB administration. The maximum rate of I.V. administration is 50 mg/minute. Highly sensitive patients (eg, elderly, patients with pre-existing cardiovascular conditions) should receive phenytoin more slowly (eg, 20 mg/minute).

Administration: I.V. DetailAn in-line 0.22-5 micron filter is recommended for IVPB solutions due to the high potential for precipitation of the solution. Avoid extravasation. Following I.V. administration, NS should be injected through the same needle or I.V. catheter to prevent irritation.

pH: 10.0-12.3

Administration: OralSuspension: Shake well prior to use. Absorption is impaired when phenytoin suspension is given concurrently to patients who are receiving continuous nasogastric feedings. A method to resolve this interaction is to divide the daily dose of phenytoin and withhold the administration of nutritional supplements for 1-2 hours before and after each phenytoin dose.

Administration: OtherSubQ administration is not recommended because of the possibility of local tissue damage (due to high pH).

Dietary Considerations

Folic acid: Phenytoin may decrease mucosal uptake of folic acid; to avoid folic acid deficiency and megaloblastic anemia, some clinicians recommend giving patients on anticonvulsants prophylactic doses of folic acid and cyanocobalamin. However, folate supplementation may increase seizures in some patients (dose dependent). Discuss with healthcare provider prior to using any supplements.

Calcium: Hypocalcemia has been reported in patients taking prolonged high-dose therapy with an anticonvulsant. Some clinicians have given an additional 4000 units/week of vitamin D (especially in those receiving poor nutrition and getting no sun exposure) to prevent hypocalcemia.

Vitamin D: Phenytoin interferes with vitamin D metabolism and osteomalacia may result; may need to supplement with vitamin D

Tube feedings: Tube feedings decrease phenytoin absorption. To avoid decreased serum levels with continuous NG feeds, hold feedings for 1-2 hours prior to and 1-2 hours after phenytoin administration, if possible. There is a variety of opinions on how to administer phenytoin with enteral feedings. Be **consistent** throughout therapy.

Sodium content of 1 g injection: 88 mg (3.8 mEq)

Storage

Capsule, tablet: Store below 30°C (86°F). Protect from light and moisture.

Oral suspension: Store at room temperature of 20°C to 25°C (68°F to 77°F); do not freeze. Protect from light.

Solution for injection: Store at room temperature of 15°C to 30°C (59°F to 86°F). Use only clear solutions free of precipitate and haziness; slightly yellow solutions may be used. Precipitation may occur if solution is refrigerated and may dissolve at room temperature.

ReconstitutionI.V.: Further dilution of the solution for I.V. infusion is controversial and no consensus exists as to the optimal concentration and length of stability. Stability is concentration and pH dependent. Based on limited clinical consensus, NS or LR are recommended diluents; dilutions of 1-10 mg/mL have been used and should be administered as soon as possible after preparation (some recommend to discard if not used within 4 hours). Do not refrigerate.

Compatibility**Incompatible** in D_5NS, D_5W, fat emulsion 10%, $^1/_2$NS; **variable stability (consult detailed reference)** in NS

Y-site administration: Compatible: Esmolol, famotidine, fluconazole, foscarnet, tacrolimus. **Incompatible:** Amphotericin B cholesteryl sulfate complex, ciprofloxacin, clarithromycin, diltiazem, enalaprilat, gatifloxacin, heparin, heparin with hydrocortisone sodium succinate, hydromorphone, linezolid, potassium chloride, propofol, sufentanil, theophylline, vitamin B complex with C. **Variable (consult detailed reference):** TPN.

Compatibility in syringe: Incompatible: Hydromorphone, sufentanil.

Compatibility when admixed: Compatible: Bleomycin, sodium bicarbonate, verapamil. **Incompatible:** Amikacin, aminophylline, bretylium, chloramphenicol, dimenhydrinate, diphenhydramine, dobutamine, hydroxyzine, insulin (regular), kanamycin, levorphanol, lidocaine, lincomycin, meperidine, metaraminol, morphine, nitroglycerin, norepinephrine, penicillin G potassium, pentobarbital, phenobarbital, phenylephrine, phytonadione, procainamide, procaine, prochlorperazine edisylate, promazine, promethazine, streptomycin, vancomycin, vitamin B complex with C.

ContraindicationsHypersensitivity to phenytoin, other hydantoins, or any component of the formulation; pregnancy

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: A spectrum of hematologic effects have been reported with use (eg, neutropenia, leukopenia, thrombocytopenia, pancytopenia, and anemias); patients with a previous history of adverse hematologic reaction to any drug may be at increased risk. Early detection of hematologic change is important; advise patients of early signs and symptoms including fever, sore throat, mouth ulcers, infections, easy bruising, petechial or purpuric hemorrhage.

- Dermatologic reactions: Severe reactions, including toxic epidermal necrolysis and Stevens-Johnson syndromes, although rarely reported, have resulted in fatalities; drug should be discontinued if there are any signs of rash. Data suggests a genetic susceptibility for serious skin reactions in patients of Asian descent (see "Special populations" below).

- Hypersensitivity syndrome: Acute hepatotoxicity associated with a hypersensitivity syndrome characterized by fever, skin eruptions, and lymphadenopathy has been reported to occur within the first 2 months of treatment; discontinue if skin rash or lymphadenopathy occurs.

- Osteomalacia: Has been reported.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with sinus bradycardia, SA block, or AV block.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Hypoalbuminemia: Use with caution in patients with any condition associated with low serum albumin levels, which will increase the free fraction of phenytoin in the serum and, therefore, the pharmacologic response.

- Porphyria: Use with caution in patients with porphyria.

- Seizures: May increase frequency of petit mal seizures.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Asian ancestry: Asian patients with the variant *HLA-B*1502* may be at an increased risk of developing Stevens-Johnson syndrome and/or toxic epidermal necrolysis.

- Debilitated patients: Use with caution in patients who are debilitated.

- Elderly: Use with caution in the elderly.

Dosage form specific issues:

- Injectable: I.V. form may cause hypotension, skin necrosis at I.V. site; avoid I.V. administration in small veins.

Other warnings/precautions:

- Serum levels: Sedation, confusional states, or cerebellar dysfunction (loss of motor coordination) may occur at higher total serum concentrations, or at lower total serum concentrations when the free fraction of phenytoin is increased.

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsElderly may have reduced hepatic clearance due to age decline in phase I metabolism. Elderly may have low albumin which will increase free fraction and, therefore, pharmacologic response. Monitor closely in those who are hypoalbuminemic. Free fraction measurements advised, also elderly may display a higher incidence of adverse effects (cardiovascular) when using the I.V. loading regimen; therefore, recommended to decrease loading I.V. dose to 25 mg/minute.

Pregnancy Risk FactorD

Pregnancy ConsiderationsPhenytoin crosses the placenta. Congenital malformations (including a pattern of malformations termed the “fetal hydantoin syndrome” or “fetal anticonvulsant syndrome”) have been reported in infants. Isolated cases of malignancies (including neuroblastoma) and coagulation defects in the neonate following delivery have also been reported. Epilepsy itself, the number of medications, genetic factors, or a combination of these probably influence the teratogenicity of anticonvulsant therapy.

Total plasma concentrations of phenytoin are decreased by 56% in the mother during pregnancy; unbound plasma (free) concentrations are decreased by 31%. Because protein binding is decreased, monitoring of unbound plasma concentrations is recommended. Concentrations should be monitored through the 8th week postpartum. The use of folic acid throughout pregnancy and vitamin K during the last month of pregnancy is recommended.

A pregnancy registry is available for women exposed to antiepileptic drug (including phenytoin) at the Genetics and Teratology Unit Massachusetts General Hospital, 1-888-233-2334.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsPhenytoin is excreted in breast milk; however, the amount to which the infant is exposed is considered small. The manufacturers of phenytoin do not recommend breast-feeding during therapy, however, the AAP considers it to be usually compatible. Women should be counseled of the possible risks and benefits associated with breast-feeding while on phenytoin.

Adverse ReactionsI.V. effects: Hypotension, bradycardia, cardiac arrhythmia, cardiovascular collapse (especially with rapid I.V. use), venous irritation and pain, thrombophlebitis

Effects not related to plasma phenytoin concentrations: Hypertrichosis, gingival hypertrophy, thickening of facial features, carbohydrate intolerance, folic acid deficiency, peripheral neuropathy, vitamin D deficiency, osteomalacia, systemic lupus erythematosus

Concentration-related effects: Nystagmus, blurred vision, diplopia, ataxia, slurred speech, dizziness, drowsiness, lethargy, coma, rash, fever, nausea, vomiting, gum tenderness, confusion, mood changes, folic acid depletion, osteomalacia, hyperglycemia

Related to elevated concentrations:

>20 mcg/mL: Far lateral nystagmus

>30 mcg/mL: 45° lateral gaze nystagmus and ataxia

>40 mcg/mL: Decreased mentation

>100 mcg/mL: Death

Cardiovascular: Hypotension, bradycardia, cardiac arrhythmia, cardiovascular collapse

Central nervous system: Psychiatric changes, slurred speech, dizziness, drowsiness, headache, insomnia

Dermatologic: Rash

Gastrointestinal: Constipation, nausea, vomiting, gingival hyperplasia, enlargement of lips

Hematologic: Leukopenia, thrombocytopenia, agranulocytosis

Hepatic: Hepatitis

Local: Thrombophlebitis

Neuromuscular & skeletal: Tremor, peripheral neuropathy, paresthesia

Ocular: Diplopia, nystagmus, blurred vision

Rarely seen effects: Blood dyscrasias, coarsening of facial features, dyskinesias, hepatitis, hypertrichosis, lymphadenopathy, lymphoma, pseudolymphoma, SLE-like syndrome, Stevens-Johnson syndrome, toxic epidermal necrolysis, venous irritation and pain

Metabolism/Transport Effects**Substrate** of CYP2C9 (major), 2C19 (major), 3A4 (minor); **Induces** CYP2B6 (strong), 2C8 (strong), 2C9 (strong), 2C19 (strong), 3A4 (strong)

Drug Interactions

Acetaminophen: Anticonvulsants (Hydantoin) may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Aminocamptothecin: Phenytoin may decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Amiodarone: Phenytoin may increase the metabolism of Amiodarone. Amiodarone may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Amphetamines: May decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Amprenavir: Phenytoin may increase the serum concentration of Amprenavir. Amprenavir may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Phenytoin. Phenytoin may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Benzodiazepines: May increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. **Exceptions:** ALPRAZolam. *Risk C: Monitor therapy*

Calcium Channel Blockers: May decrease the metabolism of Phenytoin. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Capecitabine: May increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Phenytoin. Phenytoin may increase the metabolism of CarBAMazepine. CarBAMazepine may decrease the metabolism of Phenytoin. Possibly by competitive inhibition at sites of metabolism. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Anticonvulsants (Hydantoin). Specifically, osteomalacia and rickets. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Anticonvulsants (Hydantoin). Anticonvulsants (Hydantoin) may decrease the serum concentration of Chloramphenicol. Increased chloramphenicol concentrations have also been seen. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Anticonvulsants (Hydantoin). *Risk D: Consider therapy modification*

Ciprofloxacin: May decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Clozapine: Phenytoin may increase the metabolism of Clozapine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Colesevelam: May decrease the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Contraceptive (Progestins): Phenytoin may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CycloSPORINE: Phenytoin may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inducers (Strong) may increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: Phenytoin may decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Dexmethylphenidate: May decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Diazoxide: May decrease the serum concentration of Phenytoin. Total phenytoin concentrations may be affected more than free phenytoin concentrations. *Risk C: Monitor therapy*

Disopyramide: Phenytoin may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Disulfiram: May decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Doxycycline: Phenytoin may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Efavirenz: Phenytoin may decrease the serum concentration of Efavirenz. Efavirenz may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Etoposide: Phenytoin may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Phenytoin may decrease the serum concentration of Etoposide Phosphate. Phenytoin may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Etravirine: Phenytoin may decrease the serum concentration of Etravirine. Management: The manufacturer of etravirine states these drugs should not be used in combination *Risk X: Avoid combination*

Felbamate: Phenytoin may increase the metabolism of Felbamate. Felbamate may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Floxuridine: May increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Fluconazole: May decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Flunarizine: Phenytoin may decrease the serum concentration of Flunarizine. *Risk C: Monitor therapy*

Fluorouracil: May increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Folic Acid: May decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Fosamprenavir: May decrease the serum concentration of Phenytoin. The active amprenavir metabolite is likely responsible for this effect. Phenytoin may increase the serum concentration of Fosamprenavir. Specifically, phenytoin may increase the concentration of the active metabolite amprenavir. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Phenytoin may increase the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Rosuvastatin. *Risk D: Consider therapy modification*

Irinotecan: Phenytoin may increase the metabolism of Irinotecan. *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Lacosamide: Phenytoin may decrease the serum concentration of Lacosamide. *Risk C: Monitor therapy*

LamoTRIgine: Phenytoin may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Leucovorin-Levoleucovorin: May decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Levodopa: Phenytoin may diminish the therapeutic effect of Levodopa. *Risk C: Monitor therapy*

Lithium: Phenytoin may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Loop Diuretics: Phenytoin may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Lopinavir: Phenytoin may decrease the serum concentration of Lopinavir. Lopinavir may decrease the serum concentration of Phenytoin. Management: The manufacturer of lopinavir/ritonavir recommends avoiding once-daily administration if used together with phenytoin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mebendazole: Phenytoin may decrease the serum concentration of Mebendazole. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Meperidine: Phenytoin may increase the metabolism of Meperidine. *Risk C: Monitor therapy*

Methadone: Phenytoin may increase the metabolism of Methadone. *Risk C: Monitor therapy*

Methylfolate: May decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Methylphenidate: May decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Metyrapone: Phenytoin may increase the metabolism of Metyrapone. The oral metyrapone test would thus be unreliable unless the metapyrone dosage was substantially increased (eg, 750 mg every 2 hours). *Risk D: Consider therapy modification*

Mexiletine: Phenytoin may increase the metabolism of Mexiletine. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Phenytoin may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: Phenytoin may decrease the serum concentration of OXcarbazepine. OXcarbazepine may increase the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Primidone: Phenytoin may increase the metabolism of Primidone. The ratio of primidone:phenobarbital is thus changed. *Risk C: Monitor therapy*

Proton Pump Inhibitors: May increase the serum concentration of Phenytoin. **Exceptions:** Esomeprazole; Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Pyridoxine: May increase the metabolism of Phenytoin. This is most apparent in high pyridoxine doses (eg, 80 mg to 200 mg daily) *Risk C:*

Monitor therapy

QUEtiapine: Phenytoin may increase the metabolism of QUEtiapine. *Risk D: Consider therapy modification*

QuiNIDine: Phenytoin may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Ritonavir: Phenytoin may decrease the serum concentration of Ritonavir. Ritonavir may decrease the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Rufinamide: May increase the serum concentration of Phenytoin. Phenytoin may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Phenytoin. **Exceptions:** PARoxetine. *Risk D: Consider therapy modification*

Sirolimus: Phenytoin may increase the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Tacrolimus: Phenytoin may increase the metabolism of Tacrolimus. Tacrolimus may increase the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Temsirolimus: Phenytoin may decrease the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are also likely to be decreased (and maybe to an even greater degree). Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as phenytoin; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Teniposide: Phenytoin may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Phenytoin may increase the metabolism of Theophylline Derivatives. Theophylline Derivatives may decrease the serum concentration of Phenytoin. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thyroid Products: Phenytoin may increase the metabolism of Thyroid Products. Phenytoin may also displace thyroid hormones from protein binding sites. *Risk C: Monitor therapy*

Ticlopidine: May decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Tipranavir: Phenytoin may decrease the serum concentration of Tipranavir. Tipranavir may decrease the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Topiramate: May decrease the metabolism of Phenytoin. Phenytoin may increase the metabolism of Topiramate. *Risk C: Monitor therapy*

Trimethoprim: May decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Valproic Acid: Phenytoin may increase the metabolism of Valproic Acid. A hepatotoxic metabolite of valproic acid may result. Valproic Acid may decrease the serum concentration of Phenytoin. Continued therapy usually yields a normalization (or slight increase) of serum phenytoin concentrations. Free phenytoin concentrations, however, tend to remain relatively stable (possibly increased with continued therapy). *Risk C: Monitor therapy*

Vecuronium: Phenytoin may decrease the serum concentration of Vecuronium. *Risk C: Monitor therapy*

Vigabatrin: May decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Phenytoin may enhance the anticoagulant effect of Vitamin K Antagonists. Vitamin K Antagonists may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Zonisamide: Phenytoin may increase the metabolism of Zonisamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol:

Acute use: Avoid or limit ethanol (inhibits metabolism of phenytoin). Watch for sedation.

Chronic use: Avoid or limit ethanol (stimulates metabolism of phenytoin).

Food: Phenytoin serum concentrations may be altered if taken with food. If taken with enteral nutrition, phenytoin serum concentrations may be decreased. Tube feedings decrease bioavailability; hold tube feedings 1-2 hours before and 1-2 hours after phenytoin administration. May decrease calcium, folic acid, and vitamin D levels.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased). Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersBlood pressure, vital signs (with I.V. use); plasma phenytoin level, CBC, liver function. **Note:** If available, free phenytoin concentrations should be obtained in patients with renal impairment and/or hypoalbuminemia. If free phenytoin levels are unavailable, the adjusted total level is based upon equations in adult patients.

Reference RangeTiming of serum samples: Because it is slowly absorbed, peak blood levels may occur 4-8 hours after ingestion of an oral dose. The serum half-life varies with the dosage and the drug follows Michaelis-Menten kinetics. The average adult half-life is about 24 hours. Steady-state concentrations are reached in 5-10 days.

Children and Adults: Toxicity is measured clinically, and some patients require levels outside the suggested therapeutic range

Therapeutic range:

Total phenytoin: 10-20 mcg/mL (children and adults), 8-15 mcg/mL (neonates)

Concentrations of 5-10 mcg/mL may be therapeutic for some patients but concentrations <5 mcg/mL are not likely to be effective

50% of patients show decreased frequency of seizures at concentrations >10 mcg/mL

86% of patients show decreased frequency of seizures at concentrations >15 mcg/mL

Add another anticonvulsant if satisfactory therapeutic response is not achieved with a phenytoin concentration of 20 mcg/mL

Free phenytoin: 1-2.5 mcg/mL

Total phenytoin:

Toxic: >30 mcg/mL (SI: <120-200 µmol/L)

Lethal: >100 mcg/mL (SI: >400 µmol/L)

When to draw levels: This is dependent on the disease state being treated and the clinical condition of the patient

Key points:

Slow absorption of extended capsules and prolonged half-life minimize fluctuations between peak and trough concentrations, timing of sampling not crucial

Trough concentrations are generally recommended for routine monitoring. Daily levels are not necessary and may result in incorrect dosage adjustments. If it is determined essential to monitor free phenytoin concentrations, concomitant monitoring of total phenytoin concentrations is not necessary and expensive.

After a loading dose: If rapid therapeutic levels are needed, initial levels may be drawn after 1 hour (I.V. loading dose) or within 24 hours (oral loading dose) to aid in determining maintenance dose or need to reload.

Rapid achievement: Draw within 2-3 days of therapy initiation to ensure that the patient's metabolism is not remarkably different from that which would be predicted by average literature-derived pharmacokinetic parameters; early levels should be used cautiously in design of new dosing regimens

Second concentration: Draw within 6-7 days with subsequent doses of phenytoin adjusted accordingly

If plasma concentrations have not changed over a 3- to 5-day period, monitoring interval may be increased to once weekly in the acute clinical setting

In stable patients requiring long-term therapy, generally monitor levels at 3- to 12-month intervals

Adjustment of serum concentration: See tables.

Note: Although it is ideal to obtain free phenytoin concentrations to assess serum concentrations in patients with hypoalbuminemia or renal failure (Cl_{cr} ≤10 mL/minute), it may not always be possible. If free phenytoin concentrations are unavailable, the following equations may be utilized in adult patients.

Adjustment of Serum Concentration in Adults With Low Serum Albumin

Measured Total Phenytoin Concentration (mcg/mL)	**Patient's Serum Albumin (g/dL)**			
	3.5	**3**	**2.5**	**2**
	Adjusted Total Phenytoin Concentration (mcg/mL)[1]			
5	6	7	8	10
10	13	14	17	20
15	19	21	25	30

[1] Adjusted concentration = measured total concentration divided by [(0.2 x albumin) + 0.1].

Adjustment of Serum Concentration in Adults With Renal Failure (Cl_{cr} ≤10 mL/min)

Measured Total Phenytoin Concentration (mcg/mL)	Patient's Serum Albumin (g/dL)				
	4	3.5	3	2.5	2
	Adjusted Total Phenytoin Concentration (mcg/mL)[1]				
5	10	11	13	14	17
10	20	22	25	29	33
15	30	33	38	43	50

[1] Adjusted concentration = measured total concentration divided by [(0.1 x albumin) + 0.1].

Nursing: Physical Assessment/MonitoringAssess potential for numerous interactions with other prescriptions, OTC medications, or herbal products patient may be taking (see extensive list of Drug Interactions). Assess results of laboratory tests, therapeutic effectiveness, and adverse response when beginning therapy and at regular intervals during treatment. When discontinuing oral formulation, taper dose gradually; abrupt discontinuance can cause status epilepticus. Teach patient proper use (oral), side effects/appropriate interventions, and adverse symptoms to report. **I.V.:** Monitor blood pressure. Infusion site should be monitored closely (vesicant). Patient should be monitored closely for adverse/toxic results.

Monitoring: Lab TestsPlasma phenytoin level, CBC, liver function. **Note:** If available, free phenytoin concentrations should be obtained in patients with renal impairment and/or hypoalbuminemia. If free phenytoin levels are unavailable, the adjusted total level is based upon equations in adult patients.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed, preferably on an empty stomach. Do not alter dose or discontinue without consulting prescriber. Do not crush, break, or chew extended release capsules. Shake liquid suspension well before using. Follow recommended diet, avoid alcohol, and maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause gum or mouth soreness (use good oral hygiene and have frequent dental exams); drowsiness, dizziness, nervousness, or headache (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain, irregular heartbeat, or palpitations; slurred speech, unsteady gait, coordination difficulties, or change in mentation; skin rash; unresolved nausea, vomiting, or constipation; swollen glands; swollen, sore, or bleeding gums; unusual bruising or bleeding; acute persistent fatigue; vision changes; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant; use contraceptive measures to prevent possible harm to the fetus (effectiveness of oral contraceptives may be affected by phenytoin). Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release, as sodium: 100 mg

Dilantin®: 30 mg [contains sodium benzoate], 100 mg

Phenytek®: 200 mg, 300 mg

Capsule, prompt release, as sodium: 100 mg

Injection, solution, as sodium: 50 mg/mL (2 mL, 5 mL) [contains alcohol and propylene glycol]

Suspension, oral: 100 mg/4 mL (4 mL); 125 mg/5 mL (240 mL)

Dilantin®: 125 mg/5 mL (240 mL) [contains alcohol <0.6%, sodium benzoate; orange vanilla flavor]

Tablet, chewable:

Dilantin®: 50 mg

Generic AvailableYes: Excludes chewable tablet

Pricing: U.S. (www.drugstore.com)

Capsules (Dilantin)

30 mg (90): $39.99

100 mg (90): $41.99

Capsules (Phenytek)

200 mg (30): $33.62

300 mg (30): $41.98

300 mg (100): $118.60

Capsules (Phenytoin Sodium Extended)

100 mg (90): $31.99

Capsules (Phenytoin Sodium Prompt)

100 mg (100): $25.99

Chewable (Dilantin Infatabs)

50 mg (90): $46.99

Suspension (Dilantin)

125 mg/5 mL (237): $59.99

Suspension (Phenytoin)

125 mg/5 mL (237): $28.99

Mechanism of ActionStabilizes neuronal membranes and decreases seizure activity by increasing efflux or decreasing influx of sodium ions across cell membranes in the motor cortex during generation of nerve impulses; prolongs effective refractory period and suppresses ventricular pacemaker automaticity, shortens action potential in the heart

Pharmacodynamics/Kinetics

Onset of action: I.V.: ~0.5-1 hour

Absorption: Oral: Slow

Distribution: V_d:

Neonates: Premature: 1-1.2 L/kg; Full-term: 0.8-0.9 L/kg

Infants: 0.7-0.8 L/kg

Children: 0.7 L/kg

Adults: 0.6-0.7 L/kg

Protein binding:

Neonates: ≥80% (≤20% free)

Infants: ≥85% (≤15% free)

Adults: 90% to 95%

Others: Decreased protein binding

Disease states resulting in a decrease in serum albumin concentration: Burns, hepatic cirrhosis, nephrotic syndrome, pregnancy, cystic fibrosis

Disease states resulting in an apparent decrease in affinity of phenytoin for serum albumin: Renal failure, jaundice (severe), other drugs (displacers), hyperbilirubinemia (total bilirubin >15 mg/dL), Cl_{cr} <25 mL/minute (unbound fraction is increased two- to threefold in uremia)

Metabolism: Follows dose-dependent capacity-limited (Michaelis-Menten) pharmacokinetics with increased V_{max} in infants >6 months of age and children versus adults; major metabolite (via oxidation), HPPA, undergoes enterohepatic recirculation

Bioavailability: Form dependent

Half-life elimination: Oral: 22 hours (range: 7-42 hours)

Time to peak, serum (form dependent): Oral: Extended-release capsule: 4-12 hours; Immediate release preparation: 2-3 hours

Excretion: Urine (<5% as unchanged drug); as glucuronides

Clearance: Highly variable, dependent upon intrinsic hepatic function and dose administered; increased clearance and decreased serum concentrations with febrile illness

Related Information

- Anticonvulsant Drugs of Choice
- Status Epilepticus

Dental Health: Effects on Dental TreatmentGingival hyperplasia is a common problem observed during the first 6 months of phenytoin therapy appearing as gingivitis or gum inflammation. To minimize severity and growth rate of gingival tissue begin a program of professional cleaning and patient plaque control within 10 days of starting anticonvulsant therapy.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Anesthesia and Critical Care Concerns/Other ConsiderationsBecause phenytoin induces the metabolism of many drugs, it may alter their effective blood concentration.

The vehicle which contains propylene glycol and ethanol may cause hypotension, bradycardia, arrhythmias, or asystole refractory to defibrillation. Phenytoin 50 mg/mL contains propylene glycol 414.4 mg/mL (40% v/v). Rapid intravenous administration may cause hypotension. Infuse at a rate no greater than 50 mg/minute in adults and 25 mg/minute in the elderly.

Patients on chronic phenytoin therapy require larger and more frequent doses of nondepolarizing muscle relaxants to attain the same degree of muscle relaxation. This is probably due to increased levels of alpha$_1$-acid glycoprotein released by the liver (which bind free phenytoin) during hepatic enzyme induction.

Status Epilepticus: A randomized, double-blind trial (Treiman, 1998) evaluated the efficacy of four treatments in overt status epilepticus. Treatment arms were designed based upon accepted practices of North American neurologists. The treatments were: 1) lorazepam 0.1 mg/kg, 2) diazepam 0.15 mg/kg followed by phenytoin 18 mg/kg, 3) phenytoin 18 mg/kg alone, and 4) phenobarbital 15 mg/kg. Treatment was considered successful if the seizures were terminated (clinically and by EEG) within 20 minutes of start of therapy without seizure recurrence within 60 minutes from the start of therapy. Patients who failed the first treatment received a second and a third, if necessary. Patients did not receive randomized treatments after the first one but the treating physician remained blinded. Treatment success: Lorazepam 64.9%, phenobarbital 58.2%, diazepam/phenytoin 55.8%, and phenytoin alone 43.6%. Using an intention to treat analysis, there was no statistical difference between the groups. Results of subsequent treatments in patients who failed the first therapy indicated that response rate significantly dropped regardless of treatment. Aggregate response rate to the second treatment was 7.0% and third treatment 2.3%.

Index Terms Diphenylhydantoin; DPH; Phenytoin Sodium; Phenytoin Sodium, Extended; Phenytoin Sodium, Prompt

Medication Safety Issues

Sound-alike/look-alike issues:

Physostigmine may be confused with Prostigmin®, pyridostigmine

Pronunciation(fye zoe STIG meen)

Canadian Brand NamesEserine®; Isopto® Eserine

Pharmacologic CategoryAcetylcholinesterase Inhibitor

Use: Labeled IndicationsReverse toxic, life-threatening delirium caused by atropine, diphenhydramine, dimenhydrinate, *Atropa belladonna* (deadly nightshade), or jimson weed (*Datura* spp)

Dosing: Adults**Reversal of toxic anticholinergic effects: Note:** Administer slowly over 5 minutes to prevent respiratory distress and seizures. Continuous infusions of physostigmine should never be used.

I.M., I.V.: 0.5-2 mg to start; repeat every 20 minutes until response occurs or adverse effect occurs; repeat 1-4 mg every 30-60 minutes as life-threatening symptoms recur

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Reversal of toxic anticholinergic effects** (reserve for life-threatening situations only): **Note:** Administer slowly over 5 minutes to prevent respiratory distress and seizures. Continuous infusions of physostigmine should never be used.

I.V.: 0.01-0.03 mg/kg/dose. May repeat after 5-10 minutes to a maximum total dose of 2 mg or until response occurs or adverse cholinergic effects occur.

Administration: I.V.Infuse slowly I.V. over 5 minutes. Too rapid administration can cause bradycardia and hypersalivation leading to respiratory distress and seizures.

StorageDo not use solution if cloudy or dark brown.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5W, $D_{10}W$, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, fat emulsion 10%, LR, $^1/_2NS$, NS.

Y-site administration: Compatible: Ampicillin, epinephrine, famotidine, heparin, hydrocortisone sodium succinate, potassium chloride, tolazoline, vitamin B complex with C. **Incompatible:** Dobutamine.

Compatibility in syringe: Compatible: Doxapram.

Compatibility when admixed: Compatible: Amikacin, chloramphenicol, cimetidine, netilmicin, sodium bicarbonate. **Incompatible:** Phenytoin, ranitidine. **Variable (consult detailed reference):** Oxytocin.

ContraindicationsHypersensitivity to physostigmine or any component of the formulation; GI or GU obstruction; asthma; gangrene; diabetes, cardiovascular disease; any vagotonic state; coadministration of choline esters and depolarizing neuromuscular-blocking agents

Allergy Considerations

- Cholinesterase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmias: Patient must have a normal QRS interval, as measured by ECG, in order to receive; use caution in poisoning with agents known to prolong intraventricular conduction.
- Cholinergic effects: Discontinue if symptoms of excess cholinergic activity (eg, salivation, sweating, urinary incontinence); overdosage may result in cholinergic crisis, which must be distinguished from myasthenic crisis.
- Hypersensitivity/overdose reactions: Due to the possibility of hypersensitivity or overdose/cholinergic crisis, atropine should be readily available.

Disease-related concerns:

- Anticholinergic toxicity: Not intended as a first-line agent for anticholinergic toxicity.
- Asthma: Use with caution in patients with asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease, including bradycardia.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Gangrene: Use with caution in patients with gangrene.

- Parkinson's disease: Not intended as a first-line agent for Parkinson's disease.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Concurrent drug therapy issues:

- Choline esters: Concomitant administration of choline esters is contraindicated.

- Depolarizing neuromuscular-blocking agents (ie, succinylcholine): Concomitant administration of depolarizing neuromuscular-blocking agents is contraindicated.

Dosage form specific issues:

- Benzyl alcohol: Products may contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.

- Sodium bisulfate: Products may contain sodium bisulfate.

Other warnings/precautions:

- I.V. administration: Administer slowly over 5 minutes to prevent respiratory distress and seizures. Continuous infusions should never be used.

- Tricyclic antidepressant (TCA) poisoning: Asystole and seizures have been reported when physostigmine was administered to TCA poisoned patients. Physostigmine is not recommended in patients with known or suspected TCA intoxication.

Geriatric ConsiderationsSee Warnings/Precautions.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Cardiovascular: Asystole, bradycardia, palpitation

Central nervous system: Hallucinations, nervousness, restlessness, seizure

Gastrointestinal: Diarrhea, nausea, salivation, stomach pain

Genitourinary: Urinary frequency

Neuromuscular & skeletal: Twitching

Ocular: Lacrimation, miosis

Respiratory: Bronchospasm, dyspnea, pulmonary edema, respiratory paralysis

Miscellaneous: Diaphoresis

Drug Interactions

Beta-Blockers: Acetylcholinesterase Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Cholinergic Agonists: Acetylcholinesterase Inhibitors may enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Ginkgo Biloba: May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): Acetylcholinesterase Inhibitors may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Succinylcholine: Acetylcholinesterase Inhibitors may enhance the neuromuscular-blocking effect of Succinylcholine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Ginkgo biloba may enhance the adverse/toxic effect of physostigmine; monitor.
Test InteractionsIncreased aminotransferase [ALT/AST] (S), increased amylase (S)
Monitoring ParametersECG, vital signs
Nursing: Physical Assessment/MonitoringWhen used to reverse neuromuscular block, patient must be monitored closely until full return of neuromuscular functioning. Assess bladder and sphincter adequacy prior to administering medication. Assess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions (cholinergic crisis). Assess knowledge/teach patient appropriate use of ophthalmic forms, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationMaintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, drowsiness, or hypotension (rise slowly from sitting or lying position and use caution when driving or climbing stairs); vomiting or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). Report persistent abdominal discomfort; significantly increased salivation, sweating, tearing, or urination; flushed skin; chest pain or palpitations; acute headache; unresolved diarrhea; excessive fatigue, insomnia, dizziness, or depression; increased muscle, joint, or body pain; vision changes or blurred vision; or shortness of breath or wheezing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as salicylate: 1 mg/mL (2 mL) [contains benzyl alcohol and sodium metabisulfite]

Generic AvailableYes

Mechanism of ActionInhibits destruction of acetylcholine by acetylcholinesterase which facilitates transmission of impulses across myoneural junction and prolongs the central and peripheral effects of acetylcholine

Pharmacodynamics/Kinetics

Onset of action: ~5 minutes

Duration: 1-2 hours

Absorption: I.M.: Readily absorbed

Distribution: Crosses blood-brain barrier readily and reverses both central and peripheral anticholinergic effects

Metabolism: Hepatic and via hydrolysis by cholinesterases

Half-life elimination: 15-40 minutes

Related Information

- Depression
- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Salivation.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause restlessness, nervousness, or hallucinations

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsCholinergic effects of physostigmine include bradycardia and bradydysrhythmias.

Anesthesia and Critical Care Concerns/Other ConsiderationsCholinergic effects of physostigmine include bradycardia and bradydysrhythmias.

Index TermsEserine Salicylate; Physostigmine Salicylate; Physostigmine Sulfate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Mephyton® may be confused with melphalan, methadone

Pronunciation(fye toe na DYE one)

U.S. Brand NamesMephyton®

Canadian Brand NamesAquaMEPHYTON®; Konakion; Mephyton®

Pharmacologic CategoryVitamin, Fat Soluble

Use: Labeled IndicationsPrevention and treatment of hypoprothrombinemia caused by coumarin derivative-induced or other drug-induced vitamin K deficiency, hypoprothrombinemia caused by malabsorption or inability to synthesize vitamin K; hemorrhagic disease of the newborn

Use: Unlabeled/InvestigationalTreatment of hypoprothrombinemia caused by anticoagulant rodenticides

Dosing: Adults**Note:** According to the manufacturer, SubQ is the preferred parenteral route; I.M. route should be avoided due to the risk of hematoma formation; I.V. route should be restricted for emergency use only. The American College of Chest Physicians recommends the I.V. route in patients with serious or life-threatening bleeding secondary to use of vitamin K antagonists.

Adequate intake: Males: 120 mcg/day; Females: 90 mcg/day

Hypoprothrombinemia due to drugs (other than coumarin derivatives) or factors limiting absorption or synthesis: Oral, SubQ, I.M., I.V.: Initial: 2.5-25 mg (rarely up to 50 mg)

Vitamin K deficiency (supratherapeutic INR) secondary to coumarin derivative (Ansell, 2008):

If INR above therapeutic range to <5 (no significant bleeding and rapid reversal unnecessary): Lower or hold next dose and monitor frequently; when INR approaches desired range, resume dosing with a lower dose.

If INR ≥5 and <9 (no significant bleeding): If no risk factors for bleeding exist, omit next 1 or 2 doses, monitor INR more frequently, and resume with an appropriately adjusted dose when INR in desired range.

Alternatively, if other risk factors for bleeding exist, omit next dose and administer vitamin K orally 1-2.5 mg; resume with an appropriately adjusted dose when INR in desired range.

If INR ≥5 and <9 (no significant bleeding and rapid reversal required for surgery): Administer vitamin K orally ≤5 mg and hold warfarin. Expect INR to be reduced within 24 hours; if INR still elevated, another 1-2 mg of vitamin K orally may be given.

If INR ≥9 (no significant bleeding): Hold warfarin, administer vitamin K orally 2.5-5 mg, expect INR to be reduced within 24-48 hours, monitor INR more frequently and give additional vitamin K at an appropriate dose if necessary. Resume warfarin at an appropriately adjusted dose when INR is in desired range.

If serious bleeding at any INR elevation: Hold warfarin, administer vitamin K 10 mg by slow I.V. infusion and supplement with FFP, PCC, or rFVIIa depending on the urgency of the situation; I.V. vitamin K may be repeated every 12 hours.

If life-threatening bleeding: Hold warfarin, give FFP, PCC, or rFVIIa supplemented with vitamin K 10 mg slow I.V. infusion; repeat if necessary, depending on INR.

Notes:

If mild-moderate INR elevation without major bleeding occurs, administer vitamin K orally instead of subcutaneously.

Use of high doses of vitamin K (eg, 10-15 mg) may cause warfarin resistance for ≥1 week. During this period of resistance, heparin or low molecular weight heparin may be given until INR responds.

FFP=fresh frozen plasma; PCC=prothrombin complex concentrate; rFVIIa=recombinant factor VIIa

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** According to the manufacturer, SubQ is the preferred parenteral route; I.M. route should be avoided due to the risk of hematoma formation; I.V. route should be restricted for emergency use only. The American College of Chest Physicians recommends the I.V. route in patients with serious or life-threatening bleeding secondary to use of vitamin K antagonists.

Adequate intake:

1-3 years: 30 mcg/day

4-8 years: 55 mcg/day

9-13 years: 60 mcg/day

14-18 years: 75 mcg/day

Hemorrhagic disease of the newborn:

Prophylaxis: I.M.: 0.5-1 mg within 1 hour of birth

Treatment: I.M., SubQ: 1 mg/dose/day; higher doses may be necessary if mother has been receiving oral anticoagulants

Administration: I.V.Infuse slowly; rate of infusion should not exceed 1 mg/minute (3 mg/m^2/minute in children and infants). The injectable route should be used only if the oral route is not feasible or there is a greater urgency to reverse anticoagulation.

Administration: I.V. DetailpH: 3.5-7.0

Administration: OralThe parenteral preparation has been administered orally to neonates.

Storage

Injection: Store at 15°C to 30°C (59°F to 86°F). **Note:** Store Hospira product at 20°C to 25°C (68°F to 77°F).

Oral: Store tablets at 15°C to 30°C (59°F to 86°F). Protect from light.

ReconstitutionDilute injection solution in preservative-free NS, D_5W, or D_5NS.

Extemporaneously PreparedA 1 mg/mL oral suspension was stable for only 3 days when refrigerated when compounded as follows:

Triturate six 5 mg tablets in a mortar, reduce to a fine powder, then add 5 mL each of water and methylcellulose 1% while mixing; then transfer to a graduate and qs to 30 mL with sorbitol

Shake well before using and keep in refrigerator

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 3rd ed, Cincinnati, OH: Harvey Whitney Books Co, 1997.

ContraindicationsHypersensitivity to phytonadione or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Anaphylaxis/hypersensitivity reactions: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: **[U.S. Boxed Warning]: Severe reactions resembling hypersensitivity (eg, anaphylaxis) reactions have occurred rarely during or immediately after I.V. administration (even with proper dilution and rate of administration).** Allergic reactions have also occurred with I.M. and SubQ injections.

Disease-related concerns:

- Anticoagulant induced hypoprothrombinemia: Administer a dose that will quickly lower the INR into a safe range without causing resistance to warfarin. High phytonadione doses may lead to warfarin resistance for at least one week.

- Liver disease induced hypoprothrombinemia: If initial doses do not reverse coagulopathy, then higher doses are unlikely to have any effect. **Note:** Ineffective in hereditary hypoprothrombinemia.

- Renal impairment: Use with caution in patients with renal impairment (including premature infants).

Special populations:

- Newborns: Use with caution in newborns, especially premature infants; hemolysis, jaundice, and hyperbilirubinemia have been reported with larger than recommended doses.

Dosage form specific issues:

- Aluminum: Injectable products may contain aluminum; may result in toxic levels following prolonged administration.

- Benzyl alcohol: Some dosage forms contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Appropriate route: Oral administration is the safest and requires the presence of bile salts for absorption. In obstructive jaundice or with biliary fistulas, concurrent administration of bile salts would be necessary for proper absorption. Manufacturers recommend the SubQ route over other parenteral routes, however, SubQ is less predictable when compared to the oral route, and efficacy may be delayed. The American College of Chest Physicians recommends the I.V. route in patients with serious or life-threatening bleeding secondary to use of vitamin K antagonists such as warfarin. The I.V. route should be restricted to emergency situations only where oral phytonadione cannot be used. Efficacy (eg, control of bleeding, decrease in INR) is delayed regardless of route of administration; patient management may require other treatments in the interim.

Pregnancy Risk FactorC

LactationEnters breast milk/use caution (AAP rates "compatible")

Adverse ReactionsParenteral administration: Frequency not defined.

Cardiovascular: Cyanosis, flushing, hypotension

Central nervous system: Dizziness

Dermatologic: Scleroderma-like lesions

Endocrine & metabolic: Hyperbilirubinemia (newborn; greater than recommended doses)

Gastrointestinal: Abnormal taste

Local: Injection site reactions

Respiratory: Dyspnea

Miscellaneous: Anaphylactoid reactions, diaphoresis, hypersensitivity reactions

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Vitamin K Antagonists (eg, warfarin): Phytonadione may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersPT, INR
Nursing: Physical Assessment/MonitoringNote dosing specifics according to purpose for use. Assess results of laboratory tests and patient response (degree of bleeding). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsPT, INR
Patient EducationDo not take any new medication during therapy (especially any aspirin-containing products or NSAIDs) without consulting prescriber. Oral: Take only as directed; do not take more or more often than prescribed. Consult prescriber for recommended diet. Report bleeding gums; blood in urine, stool, or vomitus; unusual bruising or bleeding; or abdominal cramping. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, aqueous colloidal: 2 mg/mL (0.5 mL); 10 mg/mL (1 mL)

Tablet: 100 mcg [OTC]

Mephyton®: 5 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Mephyton)

5 mg (30): $59.99

Mechanism of ActionPromotes liver synthesis of clotting factors (II, VII, IX, X); however, the exact mechanism as to this stimulation is unknown. Menadiol is a water soluble form of vitamin K; phytonadione has a more rapid and prolonged effect than menadione; menadiol sodium diphosphate (K_4) is half as potent as menadione (K_3).
Pharmacodynamics/Kinetics

Onset of action: Increased coagulation factors: Oral: 6-10 hours; I.V.: 1-2 hours

Peak effect: INR values return to normal: Oral: 24-48 hours; I.V.: 12-14 hours

Absorption: Oral: From intestines in presence of bile; SubQ: Variable

Metabolism: Rapidly hepatic

Excretion: Urine and feces

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay rarely cause dizziness
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsMethylphytyl Napthoquinone; Phylloquinone; Phytomenadione; Vitamin K_1

Medication Safety Issues

Sound-alike/look-alike issues:

Isopto® Carpine may be confused with Isopto® Carbachol

Salagen® may be confused with Salacid®, selegiline

International issues:

Salagen® may be confused with Poagen® which is a brand name for grass pollen extract in Portugal

Pronunciation(pye loe KAR peen)
U.S. Brand NamesIsopto® Carpine; Pilopine HS®; Salagen®
Canadian Brand NamesDiocarpine; Isopto® Carpine; Pilopine HS®; Salagen®
Pharmacologic CategoryCholinergic Agonist; Ophthalmic Agent, Antiglaucoma; Ophthalmic Agent, Miotic
Use: Labeled Indications

Ophthalmic: Management of chronic simple glaucoma, chronic and acute angle-closure glaucoma

Oral: Symptomatic treatment of xerostomia caused by salivary gland hypofunction resulting from radiotherapy for cancer of the head and neck or Sjögren's syndrome

Use: Unlabeled/InvestigationalCounter effects of cycloplegics
Use: DentalTreatment of xerostomia caused by radiation therapy in patients with head and neck cancer and from Sjögren's syndrome
Dosing: Adults

Glaucoma: Ophthalmic:

Solution: Instill 1-2 drops up to 6 times/day; adjust the concentration and frequency as required to control elevated intraocular pressure.

Gel: Instill 0.5” ribbon into lower conjunctival sac once daily at bedtime.

To counteract the mydriatic effects of sympathomimetic agents (unlabeled use): Ophthalmic solution: Instill 1 drop of a 1% solution in the affected eye.

Xerostomia: Oral:

Following head and neck cancer: 5 mg 3 times/day, titration up to 10 mg 3 times/day may be considered for patients who have not responded adequately; do not exceed 2 tablets/dose

Sjögren's syndrome: 5 mg 4 times/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Hepatic ImpairmentOral: Patients with moderate impairment: 5 mg 2 times/day regardless of indication; adjust dose based on response and tolerability. Do not use with severe impairment (Child-Pugh score 10-15)
Administration: OralAvoid administering with high-fat meal. Fat decreases the rate of absorption, maximum concentration, and increases the time it takes to reach maximum concentration.
Administration: OtherOphthalmic: If both solution and gel are used, the solution should be applied first, then the gel at least 5 minutes later. Following administration of the solution, finger pressure should be applied on the lacrimal sac for 1-2 minutes.
Storage

Gel: Store at room temperature of 2°C to 27°C (36°F to 80°F); do not freeze. Avoid excessive heat.

Tablets: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to pilocarpine or any component of the formulation; acute inflammatory disease of the anterior chamber of the eye; in addition, tablets are also contraindicated in patients with uncontrolled asthma, angle-closure glaucoma, severe hepatic impairment
Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; may have difficulty compensating for transient changes in hemodynamics or rhythm induced by pilocarpine.

Dosage form specific issues:

- Ophthalmic products: May cause decreased visual acuity, especially at night or with reduced lighting.

- Oral tablet: Use caution with controlled asthma, chronic bronchitis or COPD; may increase airway resistance, bronchial smooth muscle tone, and bronchial secretions. Use caution with cholelithiasis, biliary tract disease, nephrolithiasis; adjust dose with moderate hepatic impairment.

Geriatric ConsiderationsAssure the patient or a caregiver can adequately administer ophthalmic medication dosage form.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

Ophthalmic: Frequency not defined:

Cardiovascular: Hypertension, tachycardia

Gastrointestinal: Diarrhea, nausea, salivation, vomiting

Ocular: Burning, ciliary spasm, conjunctival vascular congestion, corneal granularity (gel 10%), lacrimation, lens opacity, myopia, retinal detachment, supraorbital or temporal headache, visual acuity decreased

Respiratory: Bronchial spasm, pulmonary edema

Miscellaneous: Diaphoresis

Oral (frequency varies by indication and dose):

>10%:

Cardiovascular: Flushing (8% to 13%)

Central nervous system: Chills (3% to 15%), dizziness (5% to 12%), headache (11%)

Gastrointestinal: Nausea (6% to 15%)

Genitourinary: Urinary frequency (9% to 12%)

Neuromuscular & skeletal: Weakness (2% to 12%)

Respiratory: Rhinitis (5% to 14%)

Miscellaneous: Diaphoresis (29% to 68%)

1% to 10%:

Cardiovascular: Edema (<1% to 5%), facial edema, hypertension (3%), palpitation, tachycardia

Central nervous system: Pain (4%), fever, somnolence

Dermatologic: Pruritus, rash

Gastrointestinal: Diarrhea (4% to 7%), dyspepsia (7%), vomiting (3% to 4%), constipation, flatulence, glossitis, salivation increased, stomatitis, taste perversion

Genitourinary: Vaginitis, urinary incontinence

Neuromuscular & skeletal: Myalgias, tremor

Ocular: Lacrimation (6%), amblyopia (4%), abnormal vision, blurred vision, conjunctivitis

Otic: Tinnitus

Respiratory: Cough increased, dysphagia, epistaxis, sinusitis

Miscellaneous: Allergic reaction, voice alteration

<1%: Abnormal dreams, abnormal thinking, alopecia, angina pectoris, anorexia, anxiety, aphasia, appetite increased, arrhythmia, arthralgia, arthritis, bilirubinemia, body odor, bone disorder, bradycardia, breast pain, bronchitis, cataract, cholelithiasis, colitis, confusion, contact dermatitis, cyst, deafness, depression, dry eyes, dry mouth, dry skin, dyspnea, dysuria, ear pain, ECG abnormality, eczema, emotional lability, eructation, erythema nodosum, esophagitis, exfoliative dermatitis, eye hemorrhage, eye pain, gastritis, gastroenteritis, gastrointestinal disorder, gingivitis, glaucoma, hematuria, hepatitis, herpes simplex, hiccup, hyperkinesias, hypoesthesia, hypoglycemia, hypotension, hypothermia, insomnia, intracranial hemorrhage, laryngismus, laryngitis, leg cramps, leukopenia, liver function test abnormal, lymphadenopathy, mastitis, melena, menorrhagia, metrorrhagia, migraine, moniliasis, myasthenia, MI, neck pain, photosensitivity reaction, nervousness, ovarian disorder, pancreatitis, paresthesia, parotid gland enlargement, peripheral edema, platelet abnormality, pneumonia, pyuria, salivary gland enlargement, salpingitis, seborrhea, skin ulcer, speech disorder, sputum increased, stridor, syncope, taste loss, tendon disorder, tenosynovitis, thrombocythemia, thrombocytopenia, thrombosis, tongue disorder, twitching, urethral pain, urinary impairment, urinary urgency, vaginal hemorrhage, vaginal moniliasis, vesiculobullous rash, WBC abnormality, yawning

Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Inhibits** CYP2A6 (weak), 2E1 (weak), 3A4 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Avoid administering oral formulation with high-fat meal; fat decreases the rate of absorption, maximum concentration and increases the time it takes to reach maximum concentration.

Monitoring ParametersIntraocular pressure, funduscopic exam, visual field testing

Nursing: Physical Assessment/MonitoringMonitor for adverse effects and response to treatment. Assess results of intraocular pressure testing, fundoscopic exam, and visual field testing on a periodic basis. Teach patient appropriate administration of ophthalmic solution.

Patient EducationUse as often as recommended. Avoid taking oral medication with a high fat meal.

Ophthalmic: Wash hands before using. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Sit or lie down. Open eye, look at ceiling, and instill prescribed amount of solution. Do not blink for 30 seconds, close eye and roll eye in all directions, and apply gentle pressure to inner corner of eye for 1-2 minutes. Temporary stinging or blurred vision may occur. You may experience altered dark adaptation; use caution when driving at night or in poorly lit environments. Report persistent pain, redness, burning, double vision, or severe headache. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, ophthalmic, as hydrochloride (Pilopine HS®): 4% (4 g) [contains benzalkonium chloride]

Solution, ophthalmic, as hydrochloride: 0.5% (15 mL); 1% (2 mL, 15 mL); 2% (2 mL, 15 mL); 3% (15 mL); 4% (2 mL, 15 mL); 6% (15 mL) [may contain benzalkonium chloride]

Isopto® Carpine: 1% (15 mL); 2% (15 mL); 4% (15 mL) [contains benzalkonium chloride]

Tablet, as hydrochloride: 5 mg, 7.5 mg

Salagen®: 5 mg, 7.5 mg

Generic AvailableYes: Hydrochloride solution, tablet

Pricing: U.S. (www.drugstore.com)

Gel (Pilopine HS)

4% (4): $55.99

Solution (Isopto Carpine)

1% (15): $31.51

2% (15): $31.46

4% (15): $32.51

Solution (Pilocarpine HCl)

0.5% (15): $7.99

1% (15): $12.99

Tablets (Pilocarpine HCl)

5 mg (90): $99.99

Tablets (Salagen)

5 mg (90): $173.62

7.5 mg (100): $249.78

Mechanism of ActionDirectly stimulates cholinergic receptors in the eye causing miosis (by contraction of the iris sphincter), loss of accommodation (by constriction of ciliary muscle), and lowering of intraocular pressure (with decreased resistance to aqueous humor outflow)

Pharmacodynamics/Kinetics

Onset of action:

Ophthalmic: Miosis: 10-30 minutes; Intraocular pressure reduction: 1 hour

Oral: 20 minutes

Duration:

Ophthalmic: Miosis: 4-8 hours; Intraocular pressure reduction: 4-12 hours

Oral: 3-5 hours

Half-life elimination: Oral: 0.76-1.35 hours; increased with hepatic impairment

Excretion: Urine

Dental Health Professional ConsiderationsPilocarpine may have potential as a salivary stimulant in individuals suffering from xerostomia induced by antidepressants and other medications. At the present time however, the FDA has not approved pilocarpine for use in drug-induced xerostomia (clinical studies required). In an attempt to discern the efficacy of pilocarpine as a salivary stimulant in patients suffering from Sjögren's syndrome (SS), Rhodus and Schuh studied 9 patients with SS given daily doses of pilocarpine over a 6-week period. A dose of 5 mg daily produced a significant overall increase in both whole unstimulated salivary flow and parotid stimulated salivary flow. These results support the use of pilocarpine to increase salivary flow in patients with SS.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentPilocarpine may antagonize the effects of anticholinergics and produce cardiac conduction abnormalities in patients receiving beta-blockers

Index TermsPilocarpine Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(pim e KROE li mus)

U.S. Brand NamesElidel®

Canadian Brand NamesElidel®

Pharmacologic Category[Immunosuppressant Agent](); [Topical Skin Product]()

Use: Labeled IndicationsShort-term and intermittent long-term treatment of mild to moderate atopic dermatitis in patients not responsive to conventional therapy or when conventional therapy is not appropriate

Dosing: Adults

Mild to moderate atopic dermatitis: Topical: Apply thin layer to affected area twice daily; rub in gently and completely. **Note:** Limit application to involved areas. Continue as long as signs and symptoms persist; discontinue if resolution occurs; re-evaluate if symptoms persist >6 weeks.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥2 years: Topical: Refer to adult dosing.

Administration: TopicalDo not use with occlusive dressings. Burning at the application site is most common in first few days; improves as atopic dermatitis improves. Limit application to areas of involvement. Continue as long as signs and symptoms persist; discontinue if resolution occurs; re-evaluate if symptoms persist >6 weeks.

StorageStore at 15°C to 30°C (59°F to 86°F); do not freeze.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to pimecrolimus or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Malignancy: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Local symptoms: May cause local symptoms (eg, burning, soreness, stinging) during first few days of treatment; usually self-resolving.
- Lymphadenopathy: May be associated with development of lymphadenopathy; possible infectious causes should be investigated. Discontinue use in patients with unknown cause of lymphadenopathy or acute infectious mononucleosis.
- Malignancy: **[U.S. Boxed Warning]: Topical calcineurin inhibitors have been associated with rare cases of lymphoma and skin malignancy;** avoid use on malignant or premalignant skin conditions (eg, cutaneous T-cell lymphoma). **Should be used for short-term and intermittent treatment using the minimum amount necessary for the control of symptoms; application should be limited to involved areas.** Safety of intermittent use for >1 year has not been established. **[U.S. Boxed Warning]: The use of Elidel® in children <2 years of age is not recommended,** particularly since the effect on immune system development is unknown.
- Skin papilloma: Papilloma/warts have been observed with use; discontinue pimecrolimus until resolution if worsening or do not respond to conventional treatment.

Disease-related concerns:

- Atopic dermatitis: Diagnosis should be reconfirmed if sign/symptoms do not improve within 6 weeks of treatment. Patients with atopic dermatitis are predisposed to skin infections, and pimecrolimus therapy has been associated with risk of developing eczema herpeticum, varicella zoster, and herpes simplex.
- Erythroderma: Safety not established in patients with generalized erythroderma.
- Skin diseases which may increase systemic absorption: Not recommended for use in patients with Netherton's syndrome or skin conditions which may increase the potential for systemic absorption.

Special populations:

- Immunocompromised patients: Should not be used in immunocompromised patients.
- Pediatrics: Not for use in children <2 years of age.

Other warnings/precautions:

- Appropriate use: Topical calcineurin agents are considered second-line therapies in the treatment of atopic dermatitis/eczema, and should be limited to use in patients who have failed or cannot tolerate treatment with other therapies. Do not apply to areas of active bacterial or viral infection; infections at the treatment site should be cleared prior to therapy.

- Sun exposure: Avoid artificial or natural sunlight exposure, even when Elidel® is not on the skin.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women; use only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Central nervous system: Headache (7% to 25%), fever (1% to 13%)

Local: Burning at application site (2% to 26%; tends to resolve/improve as lesions resolve)

Respiratory: Nasopharyngitis (8% to 27%), cough (2% to 16%), upper respiratory tract infection (4% to 19%), bronchitis (≤11%)

Miscellaneous: Influenza (3% to 13%)

1% to 10%:

Dermatologic: Skin infection (2% to 6%), folliculitis (1% to 6%), impetigo (2% to 4%), skin papilloma (warts) (≤3%), acne (≤2%), herpes simplex dermatitis (≤ 2%), molluscum contagiosum (≤2%), urticaria (≤1%)

Endocrine & metabolic: Dysmenorrhea (1% to 2%)

Gastrointestinal: Diarrhea (1% to 8%), gastroenteritis (≤7%), abdominal pain (≤4%), constipation (≤4%)

Local: Irritation at application site (≤6%), pruritus at application site (1% to 6%), erythema at application site (≤2%)

Ocular: Eye infection (≤1%)

Otic: Ear infection (1% to 6%), otitis media (1% to 3%)

Respiratory: Pharyngitis (1% to 8%), asthma (1% to 4%), asthma aggravated (≤4%), nasal congestion (1% to 3%), sinusitis (1% to 3%), epistaxis (≤3%), dyspnea (≤2%), pneumonia (≤2%), rhinorrhea (≤2%), wheezing (≤1%)

Miscellaneous: Viral infection (≤7%), tonsillitis (≤6%), hypersensitivity (3% to 5%), herpes simplex infection (≤4%), bacterial infection (1% to 2%)

<1%: Eczema herpeticum, lymphadenopathy

Postmarketing and/or case reports: Anaphylaxis, angioneurotic edema, facial edema, flushing (ethanol-associated), ocular irritation (following application near eyes), malignancy (basal cell carcinoma, squamous cell carcinoma, malignant melanoma, lymphoma), skin discoloration

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (topical pimecrolimus may increase the potential for experiencing facial flushing following the consumption of alcoholic beverages).

Nursing: Physical Assessment/MonitoringSee Administration directions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationThis medication is for external use only. Avoid alcohol use while using this medication. Do not use for any skin disorder except that for which it was prescribed. Avoid getting any medication in or close to eyes. Apply as often as directed by prescriber, in thin film to affected area. Do not cover with bandages or occlusive dressings. Wash and dry hands thoroughly before and after applying (if affected area is not on hands). Avoid artificial or natural sunlight even when drug not applied to skin. Discontinue therapy after signs and symptoms have disappeared; restart treatment at first sign of recurrence. You may experience burning at site of application, this will usually last less than 5 days, and go away as skin condition improves. You may experience headache, fever, cough, nasal or throat irritation, flu-like symptoms, diarrhea, or constipation; contact prescriber if these persist. Contact prescriber if skin condition worsens or if symptoms persist longer than 6 weeks. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical:

Elidel®: 1% (30 g, 60 g, 100 g)

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Cream (Elidel)

1% (30): $81.99

1% (60): $152.99

1% (100): $237.98

Mechanism of ActionPenetrates inflamed epidermis to inhibit T cell activation by blocking transcription of proinflammatory cytokine genes such as interleukin-2, interferon gamma (Th1-type), interleukin-4, and interleukin-10 (Th2-type). Pimecrolimus binds to the intracellular protein FKBP-12, inhibiting calcineurin, which blocks cytokine transcription and inhibits T-cell activation. Prevents release of inflammatory cytokines and mediators from mast cells *in vitro* after stimulation by antigen/IgE.

Pharmacodynamics/KineticsAbsorption: Poor when applied to 13% to 62% body surface area in adults for up to a year; detectable blood levels were observed in a higher proportion of children, as compared to adults

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Pronunciation(PI moe zide)

U.S. Brand NamesOrap®

Canadian Brand NamesApo-Pimozide®; Orap®

Pharmacologic CategoryAntipsychotic Agent, Typical

Use: Labeled IndicationsSuppression of severe motor and phonic tics in patients with Tourette's disorder who have failed to respond satisfactorily to standard treatment

Use: Unlabeled/InvestigationalPsychosis; reported use in individuals with delusions focused on physical symptoms (ie, preoccupation with parasitic infestation); Huntington's chorea; psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Tourette's disorder: Oral: Initial: 1-2 mg/day, then increase dosage as needed every other day; range is usually 7-16 mg/day; maximum: 10 mg/day or 0.2 mg/kg/day are not generally recommended.

Note: Sudden unexpected deaths have occurred in patients taking doses >10 mg.

Note: An ECG should be performed baseline and periodically thereafter, especially during dosage adjustment.

Dosing: ElderlyRecommend initial dose of 1 mg/day; periodically attempt gradual reduction of dose to determine if tic persists; follow up for 1-2 weeks before concluding the tic is a persistent disease phenomenon and not a manifestation of drug withdrawal. **Note:** An ECG should be performed baseline and periodically thereafter, especially during dosage adjustment.

Dosing: Pediatric

Tourette's disorder: Oral:

Children ≤12 years: Initial: 0.05 mg/kg preferably once at bedtime; may be increased every third day; usual range: 2-4 mg/day; do not exceed 10 mg/day (0.2 mg/kg/day)

Children >12 years: Refer to adult dosing.

Note: An ECG should be performed baseline and periodically thereafter, especially during dosage adjustment.

Dosing: Hepatic ImpairmentReduced dose is necessary.
ContraindicationsHypersensitivity to pimozide or any component of the formulation; severe CNS depression; coma; history of dysrhythmia; prolonged QT syndrome; concurrent use with QT_c-prolonging agents; hypokalemia or hypomagnesemia; concurrent use of drugs that are inhibitors of CYP3A4, including concurrent use of azole antifungals, fluvoxamine, macrolide antibiotics (such as clarithromycin or erythromycin [**Note:** The manufacturer lists azithromycin and dirithromycin in its list of contraindicated macrolides; however, these drugs do not inhibit CYP3A4 and are not expected to interact with pimozide]), mesoridazine, nefazodone, protease inhibitors (ie, atazanavir, indinavir, nelfinavir, ritonavir, saquinavir), sertraline, thioridazine, zileuton, and ziprasidone; simple tics other than Tourette's
Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics. Avoid use in patients with underlying QT prolongation, in those taking medicines that prolong the QT interval, or cause polymorphic ventricular tachycardia; monitor ECG closely for dose-related QT effects. Sudden unexplained deaths have occurred in patients taking high doses (>10 mg).

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to neuroleptics, pimozide has a moderate potency of cholinergic blockade.

- Blood dyscrasias: Myelosuppression (eg, leukopenia, agranulocytosis) has been observed with antipsychotic use; check blood counts periodically and discontinue at first signs of blood dyscrasias.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Pimozide is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Geriatric ConsiderationsNo specific clinical studies in the use of this drug in elderly; use with extreme caution in elderly due to cardiovascular effects. Consider cardiovascular effects of drugs an elderly patient may be receiving.

In the treatment of agitated, demented, older adult patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse Reactions

Frequencies >1% reported in adults (limited data) and/or children with Tourette's disorder:

Cardiovascular: Abnormal ECG (3%)

Central nervous system: Somnolence (up to 28% in children), sedation (14%), akathisia (8%), nervousness (1% to 8%), drowsiness (7%), hyperkinesias (6%), insomnia (2%), depression (2%), headache (1%)

Dermatologic: Rash (8%)

Gastrointestinal: Xerostomia (25%), constipation (20%), increased salivation (14%), diarrhea (5%), thirst (5%), appetite increased (5%), taste disturbance (5%), dysphagia (3%)

Genitourinary: Impotence (15%)

Neuromuscular & skeletal: Weakness (22%), muscle tightness (15%), rigidity (10%), myalgia (3%), torticollis (3%), tremor (3%)

Ocular: Visual disturbance (6% to 20%), accommodation decreased (20%)

Miscellaneous: Speech disorder (10%)

Frequency not established (reported in disorders other than Tourette's disorder): Anorexia, blood dyscrasias, breast edema, chest pain, diaphoresis, dizziness, excitement; extrapyramidal symptoms (akathisia, akinesia, dystonia, pseudoparkinsonism, tardive dyskinesia); facial edema, gingival hyperplasia (case report), hyper-/hypotension, hyponatremia, jaundice, libido decreased, nausea, neuroleptic malignant syndrome, orthostatic hypotension, palpitation, periorbital edema, postural hypotension, QT_c prolongation, seizure, tachycardia, ventricular arrhythmia, vomiting, weight gain/loss

Metabolism/Transport Effects**Substrate** (major) of CYP1A2, 3A4; **Inhibits** CYP2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Pimozide. *Risk X: Avoid combination*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Efavirenz: May enhance the arrhythmogenic effect of Pimozide. *Risk X: Avoid combination*

Fosaprepitant: May increase the serum concentration of Pimozide. The active metabolite aprepitant is likely responsible for this effect. *Risk X: Avoid combination*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Pimozide. QTc prolongation is a risk. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk X: Avoid combination*

Nefazodone: May decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Pimozide. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Pimozide. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Pimozide serum concentration may be increased when taken with grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: St John's wort may decrease pimozide levels. Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersECG should be performed baseline and periodically thereafter, especially during dosage adjustment; vital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS)

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions. Assess patient/caregiver knowledge of rationale for therapy and risks involved. Assess results of ophthalmic exam and laboratory tests, blood pressure, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Conduct baseline ECG and periodically during therapy (especially during dosage adjustment). Initiate at lower doses (see Dosing) and decrease dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Patient EducationUse exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results; do not discontinue without consulting prescriber. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Avoid grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience excess drowsiness, restlessness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); or constipation, dry mouth, anorexia (increased exercise, fluids, fruit, or fiber may help). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual muscle or facial movements, anxiety, abnormal thoughts, confusion, personality changes); unresolved constipation or GI effects; breast swelling (male and female) or decreased sexual ability; vision changes; respiratory difficulty; unusual cough or flu-like symptoms; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1 mg, 2 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Orap)

1 mg (60): $64.04

2 mg (60): $82.94

Mechanism of ActionPimozide, a diphenylbutylperidine antipsychotic, is a potent centrally-acting dopamine-receptor antagonist resulting in its characteristic neuroleptic effects

Pharmacodynamics/Kinetics

Absorption: 50%

Protein binding: 99%

Metabolism: Hepatic; significant first-pass effect

Half-life elimination: 50 hours

Time to peak, serum: 6-8 hours

Excretion: Urine

Related Information

- Antipsychotic Agents
- CMS: Long-Term Care Facility Thresholds
- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsLess sedation, but pimozide is more likely to cause acute extrapyramidal symptoms than chlorpromazine.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tourette's disorder: Xerostomia and increased salivation (normal salivary flow resumes upon discontinuation), taste disturbance, and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsPimozide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Child/Adolescent ConsiderationsTwenty-two children 7-16 years of age with Tourette's disorder were treated with a mean dose of 3.4 mg/day (Sallee, 1997). Twenty-four patients with Tourette's disorder were treated with 2.9 mg/day (Bruggeman, 2001).

Bruggeman R, van der Linden C, Buitelaar JK, et al, “Risperidone Versus Pimozide in Tourette's Disorder: A Comparative Double-Blind Parallel-Group Study,” *J Clin Psychiatry*, 2001, 62(1):50-6.

Sallee FR, Nesbitt L, Jackson C, et al, “Relative Efficacy of Haloperidol and Pimozide in Children and Adolescents With Tourette's Disorder,” *Am J Psychiatry*, 1997, 154(8):1057-62.

Mental Health CommentOlder antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical antipsychotics”, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Anesthesia and Critical Care Concerns/Other ConsiderationsPimozide causes less sedation but is more likely to cause extrapyramidal signs than chlorpromazine.

Pinaverium

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(pin ah VEER ee um)
Canadian Brand NamesDicetel®
Pharmacologic CategoryCalcium Channel Blocker
Use: Labeled IndicationsTreatment and relief of symptoms associated with irritable bowel syndrome (IBS); treatment of symptoms related to functional disorders of the biliary tract
Dosing: Adults**IBS, biliary spasm:** Oral: Initial: 50 mg 3 times/day; in exceptional cases, the dosage may be increased up to 100 mg 3 times/day (maximum dose: 300 mg/day). Tablets should be taken with a full glass of water during a meal/snack.
Dosing: ElderlyRefer to adult dosing.
Administration: OralDo not crush tablet. Should be taken with a glass of water during meals or snacks. The tablet should not be swallowed when in the lying position or just before bedtime.
Dietary ConsiderationsShould be taken with a full glass of water during a meal/snack.
StorageStore at 15°C to 30°C (59°F to 86°F).
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to pinaverium or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers.
- Esophageal irritation: May cause esophageal irritation; minimize risk by administering with a full glass of water with a meal/snack (do not crush tablets). Patients must be advised not to take medication when lying down or at bedtime. Avoid use in patients with possible gastroesophageal reflux or hiatal hernia.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition.
- Peripheral edema: The most common side effect is peripheral edema; occurs within 2-3 weeks of starting therapy.
- Reflex tachycardia: May occur with use.

Disease-related concerns:

- GI motility: Avoid using to treat motility dysfunction associated with underlying disease states.
- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.
- Idiopathic hypertrophic subaortic stenosis (IHSS): Use with caution in patients with IHSS.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorNot available
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women; use is not recommended.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsManufacturer advises against administration in breast-feeding women.
Adverse Reactions<1%: Abdominal distension, constipation, diarrhea, drowsiness, dyspepsia, epigastric pain, headache, nausea, rash, vertigo, xerostomia
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Dicetel® [CAN]: 50 mg, 100 mg [not available in the U.S.]

Generic AvailableNo
ManufacturerSolvay (Canada)
Mechanism of ActionBlocks influx of calcium via voltage-sensitive channels within smooth muscle cells of the gastrointestinal tract.
Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Pindolol may be confused with Parlodel®, Plendil®

Visken® may be confused with Visine®

Pronunciation(PIN doe lole)

Canadian Brand NamesApo-Pindol®; Gen-Pindolol; Novo-Pindol; Nu-Pindol; PMS-Pindolol; Visken®

Pharmacologic CategoryBeta Blocker With Intrinsic Sympathomimetic Activity

Use: Labeled IndicationsTreatment of hypertension, alone or in combination with other agents

Use: Unlabeled/InvestigationalPotential augmenting agent for antidepressants; ventricular arrhythmias/tachycardia, antipsychotic-induced akathisia, situational anxiety; aggressive behavior associated with dementia

Dosing: Adults

Hypertension: Oral: Initial: 5 mg twice daily, increase as necessary by 10 mg/day every 3-4 weeks (maximum daily dose: 60 mg); usual dose range (JNC 7): 10-40 mg twice daily.

Antidepressant augmentation (unlabeled use): Oral: 2.5 mg 3 times/day

Dosing: ElderlyOral: Initial: 5 mg once daily; increase as necessary by 5 mg/day every 3-4 weeks.

Dosing: Renal ImpairmentUse with caution. Clearance significantly decreased in uremic patients. Dosage reduction may be necessary.

Dosing: Hepatic ImpairmentUse with caution. Elimination half-life in cirrhotic patients may be 10 times as long compared to normal patients. Dosage reduction is necessary in severely impaired.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore below 30°C (86°F). Protect from light.

ContraindicationsBronchial asthma; cardiogenic shock; heart block (2nd or 3rd degree) except in patients with a functioning artificial pacemaker; overt cardiac failure; severe bradycardia

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.

- Heart failure (HF): Use with caution in patients with compensated HF and monitor for a worsening of the condition. If condition worsens, consider temporary discontinuation or dosage reduction of pindolol. Patients should be stabilized on heart failure regimen prior to initiation of beta-blocker. Beta-blocker therapy should be initiated at very low doses with gradual and very careful titration. Adjustment of other medications (ACE inhibitors and/or diuretics) may be required. Beta-blockers with intrinsic sympathomimetic activity (eg, pindolol) have not been demonstrated to be of value in HF.

- Hepatic impairment: Use with caution in patients with hepatic impairment; pindolol levels may increase significantly with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Renal impairment: Use with caution in patients with renal impairment.

- Thyrotoxicosis: Beta-blockade may mask signs of hyperthyroidism (eg, tachycardia). Abrupt discontinuation of beta-blockade may exacerbate symptoms of hyperthyroidism and may also induce thyroid storm.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function (eg, ether, cyclopropane and trichloroethylene).

- Calcium channel blockers (nondihydropyridines): Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block may occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered over 1-2 weeks to avoid acute tachycardia, hypertension, and/or ischemia.

Geriatric Considerations Due to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (eg, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults.

Pregnancy Risk Factor B

Pregnancy Considerations Adverse events were not observed in animal studies. Pindolol crosses the human placenta. Beta-blockers have been associated with bradycardia, hypotension, and IUGR; IUGR is probably related to maternal hypertension. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7).

Lactation Enters breast milk/not recommended

Breast-Feeding Considerations There is limited experience with pindolol. Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding. Monitor breast-fed infant for symptoms of beta-blockade (hypotension, bradycardia, etc) with long-term use.

Adverse Reactions

1% to 10%:

Cardiovascular: Edema (6%), chest pain (3%), bradycardia (≤2%), heart block (≤2%), hypotension (≤2%), syncope (≤2%), tachycardia (≤2%), palpitation (≤1%)

Central nervous system: Insomnia (10%), dizziness (9%), fatigue (8%), nervousness (7%), nightmares/vivid dreams (5%), anxiety (≤2%), lethargy (≤2%)

Dermatologic: Hyperhidrosis (≤2%), pruritus (1%)

Gastrointestinal: Nausea (5%), diarrhea (≤2%), vomiting (≤2%), weight gain (≤2%)

Genitourinary: Impotence (≤2%)

Hematologic: Claudication (≤2%)

Hepatic: ALT increased (7%), AST increased (7%)

Neuromuscular & skeletal: Muscle pain (10%), arthralgia (7%), weakness (4%), paresthesia (3%), muscle cramps (3%)

Ocular: Burning eyes (≤2%), visual disturbances (≤2%), eye discomfort (≤2%)

Renal: Polyuria (≤2%)

Respiratory: Dyspnea (5%), wheezing (≤2%)

Miscellaneous: Cold extremities (≤2%)

<1%, postmarketing, and/or case reports: Alkaline phosphatase increased, hallucination, heart failure, lactic acid dehydrogenase increased, uric acid increased

Other adverse reactions (noted with other beta-adrenergic-blocking agents that should be considered potential adverse events with pindolol): Agranulocytosis, alopecia, catatonia, clouded sensorium, disorientation, emotional lability, fever, intensification of pre-existing AV block, ischemic colitis, laryngospasm, mental depression, mesenteric artery thrombosis, nonthrombocytopenic purpura, Peyronie’s disease, rash (erythematous), respiratory distress, short-term memory loss, thrombocytopenic purpura

Metabolism/Transport Effects **Substrate** of CYP2D6 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, and licorice (may worsen hypertension). Avoid black cohosh, california poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, and shepherd's purse (may increase antihypertensive effect).

Monitoring ParametersBlood pressure, heart rate, respiratory function

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, anything that affects blood pressure or cardiac status). Assess patient response at beginning of therapy, when adjusting dosage, and periodically with long-term therapy (eg, cardiac, respiratory, hemodynamic status). If patient has diabetes, caution patient to monitor serum glucose levels closely (may alter glucose tolerance, potentiate hypoglycemia, or mask symptoms of hypoglycemia). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed. Do not alter dose or discontinue without consulting prescriber. If you have diabetes, monitor serum glucose closely (drug may alter glucose tolerance or mask signs of hypoglycemia). May cause nervousness, fatigue, dizziness, insomnia, or postural hypotension (use caution when changing position from lying or sitting to standing, when driving, or climbing stairs until response to medication is known); or nausea or abdominal discomfort (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain or swelling of extremities; unusual weight gain (>5 lb/week); shortness of breath; unusual muscle weakness or pain; or other persistent adverse effects. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Pindolol)

5 mg (60): $15.99

10 mg (60): $16.99

Mechanism of ActionBlocks both beta$_1$- and beta$_2$-receptors and has mild intrinsic sympathomimetic activity; pindolol has negative inotropic and chronotropic effects and can significantly slow AV nodal conduction. Augmentive action of antidepressants thought to be mediated via a serotonin 1A autoreceptor antagonism.

Pharmacodynamics/Kinetics

Absorption: Rapid, 50% to 95%

Distribution: V$_d$: ~2 L/kg

Protein binding: 40%

Metabolism: Hepatic (60% to 65%) to conjugates

Half-life elimination: 3-4 hours; prolonged with advanced age, and cirrhosis (range: 2.5-30 hours)

Time to peak, serum: ~1 hour

Excretion: Urine (35% to 40% as unchanged drug); feces (6% to 9%)

Related Information

- Beta-Blockers

Dental Health: Effects on Dental TreatmentPindolol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine has interacted with nonselective beta-blockers to result in initial hypertensive episode followed by bradycardia

Mental Health: Effects on Mental StatusInsomnia is common; may cause dizziness, fatigue, nervousness, or nightmares; may rarely cause depression or hallucinations

Mental Health: Effects on Psychiatric TreatmentHas been used as an augmentive agent to the SSRIs for the treatment of depression; barbiturates may decrease the effects of beta-blockers

Cardiovascular ConsiderationsThis drug possesses intrinsic sympathomimetic activity. While beta-blockers with intrinsic sympathomimetic activity induce fewer side effects, the cardiovascular benefits listed below are less clear than for beta-blockers without intrinsic sympathomimetic activity.

Atrial Fibrillation: Beta-blocker therapy provides effective rate control in patients with atrial fibrillation (Class IIa recommendation).

Chronic Stable Angina: Beta-blockers are effective in the treatment of angina as monotherapy or when combined with nitrates and/or calcium channel blockers. In patients with severe intractable angina requiring negative cardiac chronotropic medications, pacemaker placement has been carried out to maintain heart rate in the setting of large doses of beta-blockers and/or calcium channel blockers. Beta-blockers are ineffective in the treatment of pure vasospastic (Prinzmetal) angina. It is beneficial to start and continue beta-blocker therapy indefinitely in all patients who have had MI, acute coronary syndrome, or left ventricular dysfunction with or without heart failure symptoms, unless contraindicated (Class Ia recommendation).

Heart Failure: Strong evidence supports that beta-blocker therapy, without intrinsic sympathomimetic activity (ISA), should be initiated in select patients with **stable** congestive heart failure (NYHA Class II-III). Pindolol possesses intrinsic sympathomimetic activity and should not be used in the treatment of heart failure. To date, carvedilol, sustained release metoprolol, and bisoprolol have demonstrated a beneficial effect on morbidity and mortality. It is important that beta-blocker therapy be instituted initially at very low doses with gradual and very careful titration.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, post myocardial infarction, high coronary disease risk, or diabetes. In type-2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered over 1-2 weeks to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other ConsiderationsPindolol possesses intrinsic sympathomimetic activity. While beta-blockers with intrinsic sympathomimetic activity induce fewer side effects, the cardiovascular benefits are less clear than for beta-blockers without intrinsic sympathomimetic activity.

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered over 1-2 weeks to avoid acute tachycardia and hypertension.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(pye oh GLI ta zone & GLYE me pye ride)

U.S. Brand NamesDuetact™

Pharmacologic CategoryAntidiabetic Agent, Sulfonylurea; Antidiabetic Agent, Thiazolidinedione; Hypoglycemic Agent, Oral

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) as an adjunct to diet and exercise

Dosing: Adults**Type 2 diabetes mellitus:** Oral: Initial dose should be based on current dose of pioglitazone and/or sulfonylurea.

Patients inadequately controlled on **glimepiride** alone: Initial dose: 30 mg/2 mg or 30 mg/4 mg once daily

Patients inadequately controlled on **pioglitazone** alone: Initial dose: 30 mg/2 mg once daily

Patients with systolic dysfunction (eg, NYHA Class I and II): Initiate only after patient has been safely titrated to 30 mg of pioglitazone. Initial dose: 30 mg/2 mg or 30 mg/4 mg once daily.

Note: No exact dosing relationship exists between glimepiride and other sulfonlyureas. Dosing should be limited to less than or equal to the maximum initial dose of glimepiride (2 mg). When converting patients from other sulfonylureas with longer half lives (eg, chlorpropamide) to glimepiride, observe patient carefully for 1-2 weeks due to overlapping hypoglycemic effects.

Dosing adjustment: Dosage may be increased up to max dose and formulation strengths available; tablet should not be given more than once daily; see individual agents for frequency of adjustments. Dosage adjustments in patients with systolic dysfunction should be done carefully and patient monitored for symptoms of worsening heart failure.

Maximum dose: Pioglitazone 45 mg/glimepiride 8 mg daily

Dosing: ElderlyInitial: Glimepiride 1 mg/day prior to initiating Duetact™; dose titration and maintenance dosing should be conservative to avoid hypoglycemia. Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <22 mL/minute: Initial dose should be 1 mg of glimepiride and dosage increments should be based on fasting blood glucose levels.

Dosing: Hepatic ImpairmentDo not initiate treatment with active liver disease or ALT >2.5 times ULN. During treatment, if ALT levels elevate >3 times ULN, the test should be repeated as soon as possible. If ALT levels remain >3 times ULN or if the patient is jaundiced, Duetact™ should be discontinued.

Administration: OralAdminister once daily with the first main meal of the day. To avoid hypoglycemia, patients without oral intake may need to have the dose held.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from moisture and humidity.

ContraindicationsHypersensitivity to glimepiride, pioglitazone, or any component of the formulation; diabetic ketoacidosis (with or without coma); NYHA Class III/IV heart failure (initiation of therapy)

Warnings/Precautions

Boxed warnings:

- Heart failure/cardiac effects: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.

- Fractures: Increased incidence of bone fractures in females treated with pioglitazone; majority of fractures occurred in the lower limb and distal upper limb. Consider risk of fracture prior to initiation and during use.

- Heart failure/cardiac effects: **[U.S. Boxed Warning]: Thiazolidinediones, including pioglitazone, may cause or exacerbate heart failure;** closely monitor for signs and symptoms of heart failure (eg, rapid weight gain, dyspnea, edema), particularly after initiation or dose increases. Not recommended for use in any patient with symptomatic heart failure; initiation of therapy is contraindicated in patients with NYHA class III or IV heart failure. If used in patients with NYHA class II (systolic) heart failure, initiate at lowest dosage and monitor closely. Use with caution in patients with edema; may increase plasma volume and/or cause fluid retention. Dose reduction or discontinuation is recommended if heart failure suspected.

- Hematologic effects: May decrease hemoglobin/hematocrit; effects may be related to increased plasma volume.

- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal or hepatic function; use with caution.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

- Weight gain: Dose-related weight gain observed with pioglitazone use; mechanism unknown but likely associated with fluid retention and fat accumulation.

Disease-related concerns:

- Anemia: Use with caution in patients with anemia; may reduce hemoglobin and hematocrit.

- Diabetes, type 1: Mechanism of pioglitazone requires the presence of insulin; therefore, use in type 1 diabetes (insulin dependent, IDDM) or diabetic ketoacidosis is not recommended.

- Hepatic impairment: Use pioglitazone with caution in patients with minor elevations in transaminases (AST or ALT); do not initiate in patients with active liver disease of ALT >2.5 times the upper limit of normal at baseline. During therapy, if ALT >3 times the upper limit of normal, reevaluate levels promptly and discontinue if elevation persists or if jaundice occurs at any time during use. Idiosyncratic hepatotoxicity has been reported with another thiazolidinedione agent (troglitazone); avoid use in patients who previously experienced jaundice during troglitazone therapy.

- Macular edema/diabetic retinopathy: Use pioglitazone with caution in patients with pre-existing macular edema or diabetic retinopathy; postmarketing events of new-onset or worsening diabetic macular edema with decreased visual acuity have been reported.

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Premenopausal/anovulatory females: Use pioglitazone with caution in premenopausal, anovulatory women; may result in a resumption of ovulation, increasing the risk of pregnancy.

Geriatric ConsiderationsRapid and prolonged hypoglycemia (>12 hours) despite hypertonic glucose injections have been reported with glimepiride. Age, hepatic impairment, and renal impairment are independent risk factors for hypoglycemia; dosage titration should be made at weekly intervals. How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar of <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination; therefore, pioglitazone/glimepiride is classified as pregnancy category C. See individual agents.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsSee individual agents.

Pregnancy & Lactation, In-Depth

- Glimepiride in Pregnancy & Lactation
- Pioglitazone in Pregnancy & Lactation

Adverse ReactionsAlso see individual agents.

>10%:

Cardiovascular: Peripheral edema (6% to 12%)

Endocrine & metabolic: Hypoglycemia (13 % to 16%)

Gastrointestinal: Weight gain (9% to 13%)

Respiratory: Upper respiratory tract infection (12% to 15%)

1% to 10%:

Central nervous system: Headache (4% to 7%)

Gastrointestinal: Diarrhea (4% to 6%), nausea (4% to 5%)

Genitourinary: Urinary tract infection (6% to 7%)

Hematologic: Anemia (≤2%)

Neuromuscular & skeletal: Limb pain (4% to 5%)

Metabolism/Transport Effects

Pioglitazone: **Substrate** of CYP2C8 (major), 3A4 (minor); **Inhibits** CYP2C8 (moderate), 2C9 (weak), 2C19 (weak), 2D6 (moderate); **Induces** CYP3A4 (weak)

Glimepiride: **Substrate** of CYP2C9 (major)

Also see individual agents.

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Gemfibrozil: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Insulin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pregabalin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Trimethoprim: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Also see individual agents.

Monitoring ParametersLiver enzymes and renal function prior to initiation and periodically during treatment. If the ALT is increased to >2.5 times ULN, liver function testing should be performed more frequently until the levels return to normal or pretreatment values. **Note:** If ALT levels elevate >3 times ULN, the test should be repeated as soon as possible. If ALT levels remain >3 times ULN or if the patient is jaundiced, therapy should be discontinued. Also monitor hemoglobin A_{1C}, serum glucose and signs and symptoms of heart failure. Routine ophthalmic exams recommended; patients reporting visual deterioration should have a prompt referral to an ophthalmologist and consideration should be given to discontinuing pioglitazone.

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsHemoglobin A_{1C}, serum glucose; liver enzymes and renal function prior to initiation and periodically during treatment

Note: If the ALT is increased to >2.5 times ULN, liver function testing should be performed more frequently until the levels return to normal or pretreatment values. If ALT levels elevate >3 times ULN, the test should be repeated as soon as possible. If ALT levels remain >3 times ULN or if the patient is jaundiced, therapy should be discontinued. Also monitor hemoglobin A_{1C}, serum glucose

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Duetact™:

30 mg/2 mg: Pioglitazone 30 mg and glimepiride 2 mg

30 mg/4 mg: Pioglitazone 30 mg and glimepiride 4 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Duetact)

30-2 mg (30): $211.74

30-4 mg (30): $211.74

Mechanism of Action

Pioglitazone: A thiazolidinedione that lowers blood glucose by improving target cell response to insulin, without increasing pancreatic insulin secretion. It has a mechanism of action that is dependent on the presence of insulin for activity.

Glimepiride: A sulfonylurea that stimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentPioglitazone-dependent patients with diabetes (noninsulin dependent, type 2) or glimepiride-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue

Mental Health: Effects on Psychiatric TreatmentWeight gain is common; use caution with atypical antipsychotics. Nefazodone and other CYP3A4 inhibitors may decrease the metabolism of pioglitazone; glucose may need to be checked more frequently. Phenothiazines and TCAs may antagonize hypoglycemic effects of glimepiride; MAO inhibitors and TCAs may enhance hypoglycemic effects.

Index TermsGlimepiride and Pioglitazone; Glimepiride and Pioglitazone Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(pye oh GLI ta zone & met FOR min)

U.S. Brand NamesActoplus Met™

Pharmacologic CategoryAntidiabetic Agent, Biguanide; Antidiabetic Agent, Thiazolidinedione

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM)

Dosing: Adults**Type 2 diabetes mellitus:** Oral: Initial dose should be based on current dose of pioglitazone and/or metformin; daily dose should be divided and given with meals.

Patients inadequately controlled on **metformin alone**: Initial dose: Pioglitazone 15-30 mg/day plus current dose of metformin

Patients inadequately controlled on **pioglitazone alone**: Initial dose: Metformin 1000-1700 mg/day plus current dose of pioglitazone

Note: When switching from combination pioglitazone and metformin as separate tablets: Use current dose.

Dosing adjustment: Doses may be increased as increments of pioglitazone 15 mg and/or metformin 500-850 mg, up to the maximum dose; doses should be titrated gradually. Guidelines for frequency of adjustment (adapted from rosiglitazone/metformin combination labeling):

After a change in the **metformin** dosage, titration can be done after 1-2 weeks

After a change in the **pioglitazone** dosage, titration can be done after 8-12 weeks

Maximum dose: Pioglitazone 45 mg/metformin 2550 mg daily

Dosing: Elderly Refer to adult dosing. The initial and maintenance dosing should be conservative, due to the potential for decreased renal function (monitor). Generally, elderly patients should not be titrated to the maximum; do not use in patients ≥80 years of age unless normal renal function has been established.

Dosing: Renal ImpairmentDo not use with renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females or abnormal clearance).

Dosing: Hepatic ImpairmentDo not initiate treatment with active liver disease or ALT >2.5 times ULN. During treatment if ALT levels elevate >3 times ULN, the test should be repeated as soon as possible. If ALT levels remain >3 times ULN or if the patient is jaundiced, therapy should be discontinued.

Administration: OralAdminister with meals.

Dietary ConsiderationsShould be taken with meals. Avoid ethanol. Dietary modification based on ADA recommendations is a part of therapy. Monitor for signs and symptoms of vitamin B_{12} and/or folic acid deficiency; supplementation may be required.

Storage Store at 15°C to 30°C (59°F to 86°F). Protect from moisture and humidity.

ContraindicationsHypersensitivity to pioglitazone, metformin, or any component of the formulation; NYHA Class III/IV heart failure (initiation of therapy); renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females, or abnormal creatinine clearance which may also result from conditions such as cardiovascular collapse, acute myocardial infarction, and septicemia); acute or chronic metabolic acidosis with or without coma (including diabetic ketoacidosis); concurrent iodinated radiocontrast adminstration (manufacturer recommends temporary discontinuation of metformin)

Warnings/Precautions

Boxed warnings:

- Heart failure/cardiac effects: See “Concerns related to adverse effects” below.
- Lactic acidosis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fractures: Increased incidence of bone fractures in females treated with pioglitazone; majority of fractures occurred in the lower limb and distal upper limb. Consider risk of fracture prior to initiation and during use.
- Heart failure/cardiac effects: **[U.S. Boxed Warning]: Thiazolidinediones, including pioglitazone, may cause or exacerbate heart failure;** closely monitor for signs and symptoms of heart failure (eg, rapid weight gain, dyspnea, edema), particularly after initiation or dose increases. Not recommended for use in any patient with symptomatic heart failure; initiation of therapy is contraindicated in patients with NYHA class III or IV heart failure. If used in patients with NYHA class II (systolic) heart failure, initiate at lowest dosage and monitor closely. In addition metformin should be used with caution in patients with heart failure requiring pharmacologic management, particularly in unstable or acute heart failure due to risk of lactic acidosis secondary to hypoperfusion. Use with caution in patients with edema; may increase plasma volume and/or cause fluid retention. Dose reduction or discontinuation is recommended if heart failure suspected.
- Hematologic effects: Pioglitazone may decrease hemoglobin/hematocrit; effects may be related to increased plasma volume. Metformin may impair vitamin B_{12} absorption; monitor for anemia.

- Lactic acidosis: **[U.S. Boxed Warning]: Lactic acidosis is a rare, but potentially severe consequence of therapy with metformin.** Lactic acidosis should be suspected in any patient with diabetes receiving metformin with evidence of acidosis but without evidence of ketoacidosis. Discontinue metformin in clinical situations predisposing to hypoxemia, including conditions such as cardiovascular collapse, respiratory failure, acute myocardial infarction, acute congestive heart failure, and septicemia. The risk of accumulation and lactic acidosis increases with the degree of impairment of renal function.

- Weight gain: Dose-related weight gain observed with pioglitazone use; mechanism unknown but likely associated with fluid retention and fat accumulation.

Disease-related concerns:

- Anemia: Use pioglitazone with caution in patients with anemia; may reduce hemoglobin and hematocrit.

- Diabetes, type 1: Mechanism of pioglitazone requires the presence of insulin; therefore, use in type 1 diabetes (insulin dependent, IDDM) or diabetic ketoacidosis is not recommended.

- Hepatic impairment: Avoid metformin use in patients with impaired liver function due to potential for lactic acidosis. Use pioglitazone with caution in patients with elevated transaminases (AST or ALT); do not initiate in patients with active liver disease of ALT >2.5 times the upper limit of normal at baseline. During therapy, if ALT >3 times the upper limit of normal, reevaluate levels promptly and discontinue if elevation persists or if jaundice occurs at any time during use. Idiosyncratic hepatotoxicity has been reported with another thiazolidinedione agent (troglitazone); avoid use in patients who previously experienced jaundice during troglitazone therapy. Monitoring should include periodic determinations of liver function.

- Macular edema/diabetic retinopathy: Use pioglitazone with caution in patients with pre-existing macular edema or diabetic retinopathy; postmarketing events of new-onset or worsening diabetic macular edema with decreased visual acuity have been reported.

- Renal impairment: Metformin is substantially excreted by the kidney; patients with renal function below the limit of normal for their age should not receive therapy. Use of concomitant medications that may affect renal function (ie, affect tubular secretion) may also affect metformin disposition. Metformin should be withheld in patients with dehydration and/or prerenal azotemia.

- Stress-related states: It may be necessary to discontinue metformin and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Elderly: Metformin should not be initiated in patients ≥80 years of age unless normal renal function is confirmed.

- Pediatrics: Safety and efficacy have not been established in children.

- Premenopausal/anovulatory females: Use pioglitazone with caution in premenopausal, anovulatory women; may result in a resumption of ovulation, increasing the risk of pregnancy.

Other warnings/precautions:

- Ethanol use: Instruct patients to avoid excessive acute or chronic ethanol use; ethanol may potentiate metformin's effect on lactate metabolism.

- Iodinated contrast: Metformin therapy should be temporarily discontinued prior to or at the time of intravascular administration of iodinated contrast media (potential for acute alteration in renal function). Metformin should be withheld for 48 hours after the radiologic study and restarted only after renal function has been confirmed as normal.

- Surgical procedures: Metformin therapy should be suspended for any surgical procedures (resume only after normal intake resumed and normal renal function is verified).

Geriatric ConsiderationsIntensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies were not conducted with this combination; therefore, pioglitazone/metformin is classified as pregnancy category C. See individual agents.

Lactation

Metformin: Enters breast milk/not recommended

Pioglitazone: Excretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsSee individual agents.

Pregnancy & Lactation, In-Depth

- MetFORMIN in Pregnancy & Lactation
- Pioglitazone in Pregnancy & Lactation

Adverse ReactionsAlso see individual agents. Percentages of adverse effects as reported with the combination product.

>10%:

Cardiovascular: Edema (lower limb, 3% to 11%)

Respiratory: Upper respiratory infection (12% to 16%)

1% to 10%:

Central nervous system: Headache (2% to 6%), dizziness (5%)

Endocrine & metabolic: Weight gain (3% to 7%)

Gastrointestinal: Diarrhea (5% to 6%), nausea (4% to 6%)

Genitourinary: Urinary tract infection (5% to 6%)

Hematologic: Anemia (≤2%)

Respiratory: Sinusitis (4% to 5%)

Metabolism/Transport Effects Pioglitazone: **Substrate** of CYP2C8 (major), 3A4 (minor); **Inhibits** CYP2C8 (moderate), 2C9 (weak), 2C19 (weak), 2D6 (moderate); **Induces** CYP3A4 (weak)

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk D: Consider therapy modification*

Cephalexin: May increase the serum concentration of MetFORMIN. *Risk C: Monitor therapy*

Cimetidine: May decrease the excretion of MetFORMIN. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Gemfibrozil: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Insulin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Iodinated Contrast Agents: May enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pregabalin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Trimethoprim: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions See individual agents.

Monitoring ParametersHemoglobin A_{1c}, serum glucose; signs and symptoms of heart failure; liver enzymes prior to initiation and periodically during treatment (per clinician judgment). If the ALT is increased to >2.5 times ULN, liver function testing should be performed more frequently until the levels return to normal or pretreatment values. Patients with an elevation in ALT >3 times ULN should be rechecked as soon as possible. If the ALT levels remain >3 times ULN, therapy with pioglitazone should be discontinued. Initial and periodic monitoring of hematologic parameters (eg, hemoglobin/hematocrit and red blood cell indices) and renal function should performed. Check vitamin B_{12} and folate if anemia is present. Routine ophthalmic exams recommended; patients reporting visual deterioration should have a prompt referral to an ophthalmologist and consideration should be given to discontinuing pioglitazone.

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsHemoglobin A_{1c}, serum glucose; signs and symptoms of heart failure; liver enzymes prior to initiation and periodically during treatment (per clinician judgment). If the ALT is increased to >2.5 times ULN, liver function testing should be performed more frequently until the levels return to normal or pretreatment values. Patients with an elevation in ALT >3 times ULN should be rechecked as soon as possible. If the ALT levels remain >3 times ULN, therapy with pioglitazone should be discontinued. Initial and periodic monitoring of hematologic parameters (eg, hemoglobin/hematocrit and red blood cell indices) and renal function should performed. Check vitamin B_{12} and folate if anemia is present.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Actoplus Met™:

15/500: Pioglitazone 15 mg and metformin hydrochloride 500 mg

15/850: Pioglitazone 15 mg and metformin hydrochloride 850 mg

Generic AvailableNo

ManufacturerTakeda Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Actoplus Met)

15-500 mg (30): $108.01

15-850 mg (30): $106.94

Mechanism of Action

Pioglitazone is a thiazolidinedione antidiabetic agent that lowers blood glucose by improving target cell response to insulin, without increasing pancreatic insulin secretion. It has a mechanism of action that is dependent on the presence of insulin for activity.

Metformin decreases hepatic glucose production, decreasing intestinal absorption of glucose, and improves insulin sensitivity (increases peripheral glucose uptake and utilization).

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentPioglitazone-dependent patients with diabetes (noninsulin dependent, type 2) or metformin-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause weight gain; concomitant use with psychotropic agents may produce additive effects; monitor. May cause GI side effects, which when combined with lithium, SSRIs, valproic acid, or carbamazepine may produce additive effects.

Index TermsMetformin Hydrochloride and Pioglitazone Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Actos® may be confused with Actidose®, Actonel®

Pronunciation(pye oh GLI ta zone)

U.S. Brand NamesActos®

Canadian Brand NamesActos®; Apo-Pioglitazone; CO Pioglitazone; Gen-Pioglitazone; Novo-Pioglitazone; PMS-Pioglitazone; ratio-Pioglitazone; Sandoz-Pioglitazone; SPEF-Pioglitazone

Pharmacologic CategoryAntidiabetic Agent, Thiazolidinedione

Use: Labeled Indications

Type 2 diabetes mellitus (noninsulin dependent, NIDDM), monotherapy: Adjunct to diet and exercise, to improve glycemic control

Type 2 diabetes mellitus (noninsulin dependent, NIDDM), combination therapy with sulfonylurea, metformin, or insulin: When diet, exercise, and a single agent alone does not result in adequate glycemic control

Use: Unlabeled/Investigational

Polycystic ovary syndrome (PCOS)

Dosing: Adults**Type 2 diabetes:** Oral:

Monotherapy: Initial: 15-30 mg once daily; if response is inadequate, the dosage may be increased in increments up to 45 mg once daily; maximum recommended dose: 45 mg once daily

Combination therapy:

Note: Maximum recommended dose: 45 mg/day

With sulfonylureas: Initial: 15-30 mg once daily; dose of sulfonylurea should be reduced if the patient reports hypoglycemia

With metformin: Initial: 15-30 mg once daily; it is unlikely that the dose of metformin will need to be reduced due to hypoglycemia

With insulin: Initial: 15-30 mg once daily; dose of insulin should be reduced by 10% to 25% if the patient reports hypoglycemia or if the plasma glucose falls to below 100 mg/dL.

Dosage adjustment in patients with CHF (NYHA Class II) in mono- or combination therapy: Oral: Initial: 15 mg once daily; may be increased after several months of treatment, with close attention to heart failure symptoms

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentClearance is significantly lower in hepatic impairment (Child-Pugh Grade B/C). Therapy should not be initiated if the patient exhibits active liver disease or increased transaminases (>2.5 times ULN) at baseline. During treatment if ALT levels elevate >3 times ULN, the test should be repeated as soon as possible. If ALT levels remain >3 times ULN or if the patient is jaundiced, therapy should be discontinued.

Administration: OralMay be administered without regard to meals.

Dietary ConsiderationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) should include diet control. May be taken without regard to meals.

ContraindicationsHypersensitivity to pioglitazone or any component of the formulation; NYHA Class III/IV heart failure (initiation of therapy)

Allergy Considerations

- Thiazolidinedione Allergy

Warnings/Precautions

Boxed warnings:

• Heart failure/cardiac effects: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

• Fractures: Increased incidence of bone fractures in females treated with pioglitazone; majority of fractures occurred in the lower limb and distal upper limb. Consider risk of fracture prior to initiation and during use.

- Heart failure/cardiac effects: **[U.S. Boxed Warning]: Thiazolidinediones, including pioglitazone, may cause or exacerbate heart failure;** closely monitor for signs and symptoms of heart failure (eg, rapid weight gain, dyspnea, edema), particularly after initiation or dose increases. Not recommended for use in any patient with symptomatic heart failure; initiation of therapy is contraindicated in patients with NYHA class III or IV heart failure. If used in patients with NYHA class II (systolic) heart failure, initiate at lowest dosage and monitor closely. Use with caution in patients with edema; may increase plasma volume and/or cause fluid retention. Dose reduction or discontinuation is recommended if heart failure suspected.

- Hematologic effects: May decrease hemoglobin/hematocrit; effects may be related to increased plasma volume.

- Weight gain: Dose-related weight gain observed with use; mechanism unknown but likely associated with fluid retention and fat accumulation.

Disease-related concerns:

- Anemia: Use with caution in patients with anemia; may reduce hemoglobin and hematocrit.

- Diabetes, type 1: Mechanism requires the presence of insulin; therefore, use in type 1 diabetes (insulin dependent, IDDM) or diabetic ketoacidosis is not recommended.

- Hepatic impairment: Use with caution in patients with elevated transaminases (AST or ALT); do not initiate in patients with active liver disease of ALT >2.5 times the upper limit of normal at baseline. During therapy, if ALT >3 times the upper limit of normal, reevaluate levels promptly and discontinue if elevation persists or if jaundice occurs at any time during use. Idiosyncratic hepatotoxicity has been reported with another thiazolidinedione agent (troglitazone); avoid use in patients who previously experienced jaundice during troglitazone therapy.

- Macular edema/diabetic retinopathy: Use with caution in patients with pre-existing macular edema or diabetic retinopathy; postmarketing events of new-onset or worsening diabetic macular edema with decreased visual acuity have been reported.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Premenopausal/anovulatory females: Use with caution in premenopausal, anovulatory women; may result in a resumption of ovulation, increasing the risk of pregnancy.

Geriatric ConsiderationsNo dosage adjustment is recommended in elderly patients. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsPioglitazone is classified as pregnancy category C due to adverse effects observed in animal studies. The use of pioglitazone in pregnant women is limited to very few case reports where pregnancy occurred during treatment for polycystic ovarian syndrome (PCOS); details concerning fetal outcomes are limited. Thiazolidinediones may cause ovulation in anovulatory premenopausal women, increasing the risk of pregnancy; adequate contraception in premenopausal women is recommended. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if pioglitazone is excreted in breast milk. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Pioglitazone in Pregnancy & Lactation

Adverse Reactions

>10%:

Cardiovascular: Edema (5%; in combination trials with sulfonlyureas or insulin, the incidence of edema was as high as 15%)

Respiratory: Upper respiratory tract infection (13%)

1% to 10%:

Cardiovascular: Heart failure (requiring hospitalization; up to 6% in patients with prior macrovascular disease)

Central nervous system: Headache (9%), fatigue (4%)

Gastrointestinal: Tooth disorder (5%)

Hematologic: Anemia (≤2%)

Neuromuscular & skeletal: Myalgia (5%)

Respiratory: Sinusitis (6%), pharyngitis (5%)

<1%: CPK increased, transaminases increased

Frequency not defined: HDL-cholesterol increased, hematocrit/hemoglobin decreased, hypoglycemia (in combination trials with sulfonylureas or insulin), serum triglycerides decreased, weight gain/loss

Postmarketing and/or case reports: Bladder cancer, blurred vision, dyspnea (associated with weight gain and/or edema), fractures (females; usually in distal upper limbs or distal lower limbs), hepatic failure (very rare), hepatitis, macular edema (new onset or worsening), visual acuity decreased

Metabolism/Transport Effects **Substrate** of CYP2C8 (major), 3A4 (minor); **Inhibits** CYP2C8 (moderate), 2C9 (weak), 2C19 (weak), 2D6 (moderate); **Induces** CYP3A4 (weak)

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk D: Consider therapy modification*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Gemfibrozil: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Insulin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pregabalin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Trimethoprim: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Caution with ethanol (may cause hypoglycemia).

Food: Peak concentrations are delayed when administered with food, but the extent of absorption is not affected. Pioglitazone may be taken without regard to meals.

Herb/Nutraceutical: Caution with alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, and stinging nettle (may cause hypoglycemia).

Monitoring Parameters Hemoglobin A_{1c}, serum glucose; signs and symptoms of heart failure; liver enzymes prior to initiation and periodically during treatment (per clinician judgment). If the ALT is increased to >2.5 times the upper limit of normal, liver function testing should be performed more frequently until the levels return to normal or pretreatment values. Patients with an elevation in ALT >3 times the upper limit of normal should be rechecked as soon as possible. If the ALT levels remain >3 times the upper limit of normal, therapy with pioglitazone should be discontinued. Routine ophthalmic exams are recommended; patients reporting visual deterioration should have a prompt referral to an ophthalmologist and consideration should be given to discontinuing pioglitazone.

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking. Assess results of laboratory tests. and response to therapy frequently until patient is stable. Monitor for signs of heart failure (weight gain, edema, dyspnea). Monitor for adverse response. Assess knowledge/teach risks of hyper-/hypoglycemia, symptoms, and treatment. Refer patient to a diabetic educator, if available.

Monitoring: Lab TestsHemoglobin A_{1c}, serum glucose, liver enzymes prior to initiation and periodically during treatment (per clinician judgment); if the ALT is increased to >2.5 times ULN, liver function testing should be performed more frequently until the levels return to normal or pretreatment values. Patients with an elevation in ALT >3 times ULN should be rechecked as soon as possible. If the ALT levels remain >3 times ULN, therapy with pioglitazone should be discontinued.

Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. May be taken without regard to meals. Avoid or use caution with alcohol while taking this medication. If dose is missed, take as soon as possible. If dose is missed completely one day, do not double dose the next day. Follow dietary, exercise, and glucose monitoring instructions of prescriber (more frequent monitoring may be advised in periods of stress, trauma, surgery, increased exercise etc). Report respiratory infection, unusual weight gain, aggravation of hyper-/hypoglycemic condition, unusual swelling of extremities, shortness of breath, fatigue, yellowing of skin or eyes, dark urine, pale stool, nausea/vomiting, abdominal pain, or muscle pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Use alternate means of contraception if using oral contraceptives. You may be at increased risk of pregnancy while taking this medication. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablets (Actos)

15 mg (30): $141.98

30 mg (30): $203.31

45 mg (30): $222.38

Mechanism of ActionThiazolidinedione antidiabetic agent that lowers blood glucose by improving target cell response to insulin, without increasing pancreatic insulin secretion. It has a mechanism of action that is dependent on the presence of insulin for activity. Pioglitazone is a potent and selective agonist for peroxisome proliferator-activated receptor-gamma (PPARgamma). Activation of nuclear PPARgamma receptors influences the production of a number of gene products involved in glucose and lipid metabolism. PPARgamma is abundant in the cells within the renal collecting tubules; fluid retention results from stimulation by thiazolidinediones which increases sodium reabsorption.

Pharmacodynamics/Kinetics

Onset of action: Delayed

Peak effect: Glucose control: Several weeks

Distribution: V_{ss} (apparent): 0.63 L/kg

Protein binding: 99.8%; primarily to albumin

Metabolism: Hepatic (99%) via CYP2C8 and 3A4 to both active and inactive metabolites

Half-life elimination: Parent drug: 3-7 hours; Total: 16-24 hours

Time to peak: ~2 hours; delayed with food

Excretion: Urine (15% to 30%) and feces as metabolites

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tooth disorder. Pioglitazone-dependent diabetics should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue

Mental Health: Effects on Psychiatric TreatmentWeight gain is common; caution with atypical antipsychotics; nefazodone and other CYP3A4 inhibitors may decrease the metabolism of pioglitazone; glucose may need to be checked more frequently

Cardiovascular ConsiderationsThe glitazones are peroxisome proliferator-activated receptor gamma (PPAR gamma) agonists used to treat type 2 diabetes. Their actions ameliorate insulin resistance and could positively affect cardiovascular risk.

The PROACTIVE study is a randomized, double-blind, placebo-controlled study of type 2 diabetes with macrovascular disease (Dormandy JA, 2005). Patients received either placebo or pioglitazone (45 mg/day). The primary endpoint included all-cause mortality, nonfatal MI, stroke, ACS, and a variety of CV interventions. The secondary endpoint was all-cause mortality, nonfatal MI, and stroke. Over 5000 patients were enrolled and followed for a mean of 2.8 years. The secondary endpoint was achieve in 301 (12.3%) of pioglitazone patients and 358 (14.4%) of placebo patients. Pioglitazone significantly reduced (p = 0.02; CI 0.72-0.98) the incidence of all-cause mortality, nonfatal MI, and stroke in this population. The incidence of edema (without heart failure), heart failure, and weight gain were increased in the pioglitazone group.

Zosyn® may be confused with Zofran®, Zyvox®

Pronunciation(pi PER a sil in & ta zoe BAK tam SOW dee um)

U.S. Brand NamesZosyn®

Canadian Brand NamesTazocin®

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of moderate-to-severe infections caused by susceptible organisms, including infections of the lower respiratory tract (community-acquired pneumonia, nosocomial pneumonia); urinary tract; uncomplicated and complicated skin and skin structures; gynecologic (endometritis, pelvic inflammatory disease); bone and joint infections; intra-abdominal infections (appendicitis with rupture/abscess, peritonitis); and septicemia. Tazobactam expands activity of piperacillin to include beta-lactamase producing strains of *S. aureus*, *H. influenzae*, *Bacteroides*, and other gram-negative bacteria.

Dosing: Adults

Diverticulitis, intra-abdominal abscess, peritonitis: I.V.: 3.375 g every 6 hours; **Note:** Some clinicians use 4.5 g every 8 hours for empiric coverage since the %time>MIC is similar between the regimens for most pathogens; however, this regimen is NOT recommended for nosocomial pneumonia or *Pseudomonas* coverage.

Pneumonia (nosocomial): I.V.: 4.5 g every 6 hours for 7-14 days (when used empirically, combination with an aminoglycoside or antipseudomonal fluoroquinolone is recommended; consider discontinuation of additional agent if *P. aeruginosa* is not isolated)

Severe infections: I.V.: 3.375 g every 6 hours for 7-10 days; **Note:** Some clinicians use 4.5 g every 8 hours for empiric coverage since the %time>MIC is similar between the regimens for most pathogens; however, this regimen is NOT recommended for nosocomial pneumonia or *Pseudomonas* coverage.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Usual dosage range:** Children: I.V.:

2-8 months: 80 mg of piperacillin component/kg every 8 hours

≥9 months and ≤40 kg: 100 mg of piperacillin component/kg every 8 hours

Indication-specific dosing: I.V.: **Note:** Dosing based on piperacillin component:

Appendicitis, peritonitis: Children:

2-8 months: 80 mg/kg every 8 hours

≥9 months and ≤40 kg: 100 mg/kg every 8 hours

>40 kg: refer to adult dosing

Cystic fibrosis, pseudomonal infections (unlabeled use): 350-450 mg/kg/day in divided doses

Dosing: Renal Impairment

Cl_{cr} 20-40 mL/minute: Administer 2.25 g every 6 hours (3.375 g every 6 hours for nosocomial pneumonia)

Cl_{cr} <20 mL/minute: Administer 2.25 g every 8 hours (2.25 g every 6 hours for nosocomial pneumonia)

Hemodialysis/CAPD: Administer 2.25 g every 12 hours (2.25 g every 8 hours for nosocomial pneumonia) with an additional dose of 0.75 g after each hemodialysis session

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 2.25 g every 6 hours

CVVHD/CVVHDF: 2.25-3.375 g every 6 hours

Note: Higher dose of 3.375 g should be considered when treating resistant pathogens (especially *Pseudomonas*); alternative recommendations suggest dosing of 4.5 g every 8 hours; regardless of regimen, there is some concern of tazobactam (TAZ) accumulation, given its lower clearance relative to piperacillin (PIP). Some clinicians advocate dosing with PIP to alternate with

PIP/TAZ, particularly in CVVH-dependent patients, to lessen this concern.

Dosing: Hepatic ImpairmentHepatic impairment does not affect the kinetics of piperacillin or tazobactam significantly.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Administer by I.V. infusion over 30 minutes.

Some penicillins (eg, carbenicillin, ticarcillin and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered. **Note:** Reformulated Zosyn® containing EDTA has been shown to be compatible *in vitro* for Y-site infusion with amikacin and gentamicin, but not compatible with tobramycin.

Dietary Considerations

Infusion, premixed: 2.25 g contains sodium 5.58 mEq (128 mg); 3.375 g contains sodium 8.38 mEq (192 mg); 4.5 g contains sodium 11.17 mEq (256 mg)

Injection, powder for reconstitution: 2.25 g contains sodium 5.58 mEq (128 mg); 3.375 g contains sodium 8.38 mEq (192 mg); 4.5 g contains sodium 11.17 mEq (256 mg); 40.5 g contains sodium 100.4 mEq (2304 mg, bulk pharmacy vial)

Storage

Vials: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Use single-dose vials immediately after reconstitution (discard unused portions after 24 hours at room temperature and 48 hours if refrigerated). After reconstitution, vials or solution are stable in NS or D_5W for 24 hours at room temperature and 48 hours (vials) or 7 days (solution) when refrigerated.

Premixed solution: Store frozen at -20°C (-4°F). Thawed solution is stable for 24 hours at room temperature or 14 days under refrigeration; do not refreeze.

ReconstitutionReconstitute with 5 mL of diluent per 1 g of piperacillin and then further dilute.

CompatibilityStable in dextran 6% in NS, D_5W, NS, sterile water for injection; LR (EDTA-formulated product only); **variable stability (consult detailed reference)** in peritoneal dialysis solution.

Y-site administration: Compatible: Amikacin (EDTA formulated product only), aminophylline, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefepime, cimetidine, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, diphenhydramine, docetaxel, dopamine, enalaprilat, etoposide, etoposide phosphate, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, gentamicin (EDTA formulated product only), granisetron, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, ifosfamide, leucovorin, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metronidazole, morphine, ondansetron, plicamycin, potassium chloride, ranitidine, remifentanil, sargramostim, sodium bicarbonate, thiotepa, vinblastine, vincristine, zidovudine. **Incompatible:** Acyclovir, alatrofloxacin, amphotericin B, amphotericin B cholesteryl sulfate complex, chlorpromazine, cisplatin, dacarbazine, daunorubicin, dobutamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, famotidine, ganciclovir, gatifloxacin, gemcitabine, haloperidol, hydroxyzine, idarubicin, minocycline, mitomycin, mitoxantrone, nalbuphine, prochlorperazine edisylate, promethazine, streptozocin, tobramycin. **Variable (consult detailed reference):** Cisatracurium, vancomycin.

Compatibility when admixed: Compatible: Potassium chloride. **Incompatible:** Aminoglycosides.

ContraindicationsHypersensitivity to penicillins, beta-lactamase inhibitors, or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Bleeding disorders: Particularly in patients with renal impairment, bleeding disorders have been observed; discontinue if thrombocytopenia or bleeding occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Cystic fibrosis: An increased frequency of fever and rash has been reported in patients with cystic fibrosis.

- Renal impairment: Use with caution in patients with renal impairment or underdeveloped kidneys; due to sodium load and to the adverse effects of high serum concentrations of penicillins. Dosage adjustment recommended.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 months of age.

Geriatric ConsiderationsHas not been studied exclusively in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, piperacillin/tazobactam is classified as pregnancy category B. Piperacillin and tazobactam both cross the placenta and are found in the fetal serum, placenta, amniotic fluid, and fetal urine. When used during pregnancy, the clearance and volume of distribution of piperacillin/tazobactam are increased; half-life and AUC are decreased.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsLow concentrations of piperacillin are excreted in breast milk; information for tazobactam is not available. The manufacturer recommends that caution be exercised when administering piperacillin/tazobactam to nursing women. Other pencillins are considered safe for use during breast-feeding. Nondose-related effects could include modification of bowel flora. When given alone in the early postpartum period, some pharmacokinetic parameters of piperacillin may be altered (refer to Piperacillin monograph for details).

Pregnancy & Lactation, In-Depth

- Piperacillin and Tazobactam Sodium in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea (7% to 11%)

>1% to 10%:

Cardiovascular: Hypertension (2%)

Central nervous system: Insomnia (7%), headache (8%), fever (2% to 5%), agitation (2%), pain (2%)

Dermatologic: Rash (4%), pruritus (3%)

Gastrointestinal: Constipation (1% to 8%), nausea (7%), vomiting (3% to 4%), dyspepsia (3%), stool changes (2%), abdominal pain (1% to 2%)

Hepatic: Transaminases increased

Local: Local reaction (3%), abscess (2%)

Respiratory: Pharyngitis (2%)

Miscellaneous: Moniliasis (2%), sepsis (2%), infection (2%)

≤1%, postmarketing, and/or case reports: Agranulocytosis, anaphylaxis/anaphylactoid reaction, anemia, anxiety, arrhythmia, arthralgia, atrial fibrillation, back pain, bradycardia, bronchospasm, candidiasis, cardiac arrest, cardiac failure, circulatory failure, chest pain, cholestatic jaundice, confusion, convulsions, coughing, depression, diaphoresis, dizziness, dyspnea, dysuria, edema, epistaxis, erythema multiforme, flatulence, flushing, gastritis, genital pruritus, hallucination, hematuria, hemolytic anemia, hemorrhage, hepatitis, hiccough, hypoglycemia, hypotension, ileus, incontinence, inflammation, injection site reaction, interstitial nephritis, leukorrhea, malaise, mesenteric embolism, myalgia, myocardial infarction, oliguria, pancytopenia, phlebitis, photophobia, pseudomembranous colitis, pulmonary edema, pulmonary embolism, purpura, renal failure, rhinitis, rigors, Stevens-Johnson syndrome, syncope, tachycardia (supraventricular and ventricular), taste perversion, thirst, thrombocytopenia, thrombocytosis, thrombophlebitis, tinnitus, toxic epidermal necrolysis, tremor, ulcerative stomatitis, urinary retention, vaginitis, ventricular fibrillation, vertigo

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Aminoglycosides: Penicillins may decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. *Risk D: Consider therapy modification*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsPositive Coombs' [direct] test; false positive reaction for urine glucose using copper-reduction method (Clinitest®); may result in false positive results with the Platelia® *Aspergillus* enzyme immunoassay (EIA)

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration. **Note:** Reformulated Zosyn® containing EDTA has been shown to be compatible *in vitro* for Y-site infusion with amikacin and gentamicin, but not compatible with tobramycin.

Monitoring ParametersCreatinine, BUN, CBC with differential, PT, PTT; signs of bleeding; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringSee individual agent for Piperacillin.

Monitoring: Lab TestsLFTs, creatinine, BUN, CBC with differential, serum electrolytes, urinalysis, PT, PTT; perform culture and sensitivity before administering first dose.

Patient EducationSee individual agent for Piperacillin.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: 8:1 ratio of piperacillin sodium/tazobactam sodium

Infusion [premixed iso-osmotic solution, frozen]:

- 2.25 g: Piperacillin 2 g and tazobactam 0.25 g (50 mL) [contains sodium 5.58 mEq (128 mg) and EDTA]
- 3.375 g: Piperacillin 3 g and tazobactam 0.375 g (50 mL) [contains sodium 8.38 mEq (192 mg) and EDTA]
- 4.5 g: Piperacillin 4 g and tazobactam 0.5 g (50 mL) [contains sodium 11.17 mEq (256 mg) and EDTA]

Injection, powder for reconstitution:

- 2.25 g: Piperacillin 2 g and tazobactam 0.25 g [contains sodium 5.58 mEq (128 mg) and EDTA]
- 3.375 g: Piperacillin 3 g and tazobactam 0.375 g [contains sodium 8.38 mEq (192 mg) and EDTA]
- 4.5 g: Piperacillin 4 g and tazobactam 0.5 g [contains sodium 11.17 mEq (256 mg) and EDTA]
- 40.5 g: Piperacillin 36 g and tazobactam 4.5 g [contains sodium 100.4 mEq (2304 mg) and EDTA; bulk pharmacy vial]

Generic AvailableNo

ManufacturerLederle Laboratories

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Zosyn)

- 2-0.25 g (1): $130.02
- 3-0.375 g (1): $182.99
- 4-0.5 g (1): $229.99
- 36-4.5 g (1): $246.00

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested. Tazobactam inhibits many beta-lactamases, including staphylococcal penicillinase and Richmond and Sykes types II, III, IV, and V, including extended spectrum enzymes; it has only limited activity against class I beta-lactamases other than class Ic types.

Pharmacodynamics/KineticsBoth AUC and peak concentrations are dose proportional; hepatic impairment does not affect kinetics

Distribution: Well into lungs, intestinal mucosa, skin, muscle, uterus, ovary, prostate, gallbladder, and bile; penetration into CSF is low in subject with noninflamed meninges

Protein binding: Piperacillin and tazobactam: ~30%

Metabolism:

- Piperacillin: 6% to 9% to desethyl metabolite (weak activity)
- Tazobactam: ~26% to inactive metabolite

Bioavailability:

- Piperacillin: I.M.: 71%
- Tazobactam: I.M.: 84%

Half-life elimination: Piperacillin and tazobactam: 0.7-1.2 hours

Time to peak, plasma: Immediately following infusion of 30 minutes

Excretion: Clearance of both piperacillin and tazobactam are directly proportional to renal function

- Piperacillin: Urine (68% as unchanged drug); feces (10% to 20%)
- Tazobactam: Urine (80% as unchanged drug; remainder as inactive metabolite)

Related Information

- Antimicrobial Drugs of Choice

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Prolonged use of penicillins may lead to development of oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia, dizziness or agitation; may rarely cause confusion; penicillins reported to cause apprehension, illusions, hallucinations, depersonalization, agitation, encephalopathy, and insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Piperacillin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(pi PER a sil in)

Canadian Brand NamesPiperacillin for Injection, USP

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of susceptible infections such as septicemia, acute and chronic respiratory tract infections, skin and soft tissue infections, and urinary tract infections due to susceptible strains of *Pseudomonas*, *Proteus*, and *Escherichia coli* and *Enterobacter*; active against some streptococci and some anaerobic bacteria; febrile neutropenia (as part of combination regimen)

Dosing: Adults

Usual dosage range:

I.M.: 2-3 g/dose every 6-12 hours; maximum: 24 g/24 hours

I.V.: 3-4 g/dose every 4-6 hours; maximum: 24 g/24 hours

Burn wound sepsis: I.V.: 4 g every 4 hours with vancomycin and amikacin

Cholangitis, acute: I.V.: 4 g every 6 hours

Keratitis*(Pseudomonas):* Ophthalmic: 6-12 mg/mL every 15-60 minutes around the clock for 24-72 hours, then slow reduction

Malignant otitis externa: I.V.: 4-6 g every 4-6 hours with tobramycin

Moderate infections: I.M., I.V.: 2-3 g/dose every 6-12 hours (maximum: 2 g I.M./site)

Prosthetic joint *(Pseudomonas):* I.V.: 3 g every 6 hours with aminoglycoside

***Pseudomonas* infections:** I.V.: 4 g every 4 hours

Severe infections: I.M., I.V.: 3-4 g/dose every 4-6 hours (maximum: 24 g/24 hours)

Urinary tract infections: I.V.: 2-3 g/dose every 6-12 hours

Uncomplicated gonorrhea: I.M.: 2 g in a single dose accompanied by 1 g probenecid 30 minutes prior to injection

Dosing: ElderlyAdjust dose for renal impairment:

I.M.: 1-2 g every 8-12 hours

I.V.: 2-4 g every 6-8 hours

Dosing: Pediatric

Usual dosage range:

Neonates: I.M., I.V.: 100 mg/kg every 12 hours

Infants and Children: I.M., I.V.: 200-300 mg/kg/day in divided doses every 4-6 hours

Cystic fibrosis: I.M., I.V.: 350-500 mg/kg/day in divided doses every 4-6 hours

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 6-8 hours.

Cl_{cr} <10 mL/minute: Administer every 8 hours.

Moderately dialyzable (20% to 50%)

Continuous arteriovenous or venovenous hemofiltration: Dose as for Cl_{cr} 10-50 mL/minute.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.MDo not administer more than 2 g per injection site.

Administration: I.VAdminister around-the-clock to promote less variation in peak and trough serum levels. Give at least 1 hour apart from aminoglycosides. Rapid administration can lead to seizures. Administer direct I.V. over 3-5 minutes. Intermittently infusion over 30 minutes.

Some penicillins (eg, carbenicillin, ticarcillin and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Administration: I.V. DetailpH: 5.5-7.5

Dietary ConsiderationsSodium content of 1 g: 1.85 mEq

StorageReconstituted solution is stable (I.V. infusion) in NS or D_5W for 24 hours at room temperature, 7 days when refrigerated, or 4 weeks when frozen. After freezing, thawed solution is stable for 24 hours at room temperature or 48 hours when refrigerated. 40 g bulk vial should **not** be frozen after reconstitution.

CompatibilityStable in dextran 6% in NS, D_5NS, D_5W, LR, NS, sterile water for injection, bacteriostatic water; **variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, aztreonam, ciprofloxacin, cyclophosphamide, diltiazem, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, famotidine, fludarabine, foscarnet, granisetron, heparin, hydromorphone, IL-2, labetalol, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, midazolam, morphine, perphenazine, propofol, ranitidine, remifentanil, tacrolimus, teniposide, theophylline, thiotepa, verapamil, zidovudine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, filgrastim, fluconazole, gatifloxacin, gemcitabine, ondansetron, sargramostim, vinorelbine. **Variable (consult detailed reference):** Cisatracurium, vancomycin.

Compatibility in syringe: Compatible: Heparin.

Compatibility when admixed: Compatible: Ciprofloxacin, clindamycin, flucloxacillin, fluconazole, hydrocortisone sodium succinate, linezolid, ofloxacin, potassium chloride, verapamil. **Incompatible:** Aminoglycosides.

ContraindicationsHypersensitivity to piperacillin, other beta-lactam antibiotics (penicillins or cephalosporins), or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Bleeding disorders: Particularly in patients with renal impairment, bleeding disorders have been observed; discontinue if thrombocytopenia or bleeding occurs.

- Leukopenia/neutropenia: During prolonged use, leukopenia and neutropenia have been reported.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Cystic fibrosis: An increased frequency of fever and rash has been reported in patients with cystic fibrosis.

- Renal impairment: Use with caution in patients with renal impairment, due to sodium load and adverse effects (anemia, neuropsychological changes); dosage adjustment recommended.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Geriatric ConsiderationsAntipseudomonal penicillins should not be used alone and are often combined with an aminoglycoside as empiric therapy for lower respiratory infection and sepsis in which gram-negative (including *Pseudomonas*) and/or anaerobes are of a high probability. Because of piperacillin's lower sodium content, it is preferred over ticarcillin in patients with a history of heart failure and/or renal or hepatic disease. Adjust dose for renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, piperacillin is classified as pregnancy category B. Piperacillin crosses the placenta and distributes into the amniotic fluid. Due to pregnancy induced physiologic changes, some pharmacokinetic parameters of piperacillin may be altered. At term, the apparent volume of distribution of piperacillin is increased and peak concentrations are significantly lower. Total clearance is normal to increased at term. These changes continue into the early postpartum period.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsSmall amounts of piperacillin are excreted in breast milk. The manufacturer recommends that caution be exercised when administering piperacillin to nursing women. Other penicillins are considered safe for use during breast-feeding. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Piperacillin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Confusion, convulsions, drowsiness, fever, Jarisch-Herxheimer reaction

Dermatologic: Rash, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Electrolyte imbalance, hypokalemia

Hematologic: Abnormal platelet aggregation and prolonged PT (high doses), agranulocytosis, Coombs' reaction (positive), hemolytic anemia, pancytopenia

Local: Thrombophlebitis

Neuromuscular & skeletal: Myoclonus

Renal: Acute interstitial nephritis, acute renal failure

Miscellaneous: Anaphylaxis, hypersensitivity reactions

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Aminoglycosides: Penicillins may decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. *Risk D: Consider therapy modification*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsMay interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®); false-positive urinary and serum proteins, positive Coombs' test [direct]. False-positive Platelia® *Aspergillus* EIA test (Bio-Rad Laboratories) has been reported.

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose
Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to starting therapy. Use caution with impaired renal function and history of seizure activity. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increase or decrease levels/effect of penicillin or increase risk of toxicity). See Administration for infusion directions. Evaluate therapeutic effectiveness (resolution of infection) and adverse reactions (eg, hypersensitivity reactions, opportunistic infection [fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue], confusion, convulsions, rash, thrombophlebitis, renal failure). Advise patients with diabetes about use of Clinitest®; may cause false positive test results. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsPerform culture and sensitivity before administering first dose.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be given by injection or infusion. Report immediately any redness, swelling, burning, or pain at infusion/injection site or any signs of allergic reaction (eg, respiratory difficulty or swallowing, chest tightness, rash, hives, swelling of lips or mouth). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, drug may cause false test results with Clinitest®, consult prescriber for alternative method of glucose monitoring. May cause confusion or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report chest pain, palpitations, or irregular heartbeat; unusual confusion, pain, swelling or heat in legs, changes in urinary pattern, signs of an opportunistic infection (fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue), persistent diarrhea, or other persistent adverse effects.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 2 g, 3 g, 4 g, 40 g

Generic AvailableYes
ManufacturerLederle Laboratories
Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.
Pharmacodynamics/Kinetics

Absorption: I.M.: 70% to 80%

Protein binding: ~16%

Bioavailability: Not well absorbed when given orally

Half-life elimination (dose dependent; prolonged with moderately severe renal or hepatic impairment):

Neonates: 1-5 days old: 3.6 hours; >6 days old: 2.1-2.7 hours

Children: 1-6 months: 0.79 hour; 6 months to 12 years: 0.39-0.5 hour

Adults: 36-80 minutes

Time to peak, serum: I.M.: 30-50 minutes

Excretion: Primarily urine; partially feces

Piperazine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(PI per a zeen)

Canadian Brand NamesEntacyl®

Pharmacologic CategoryAnthelmintic

Use: Labeled IndicationsTreatment of pinworm and roundworm infections (used as an alternative to first-line agents, mebendazole, or pyrantel pamoate)

Dosing: Adults

Pinworm eradication: Oral: 65 mg/kg/day (not to exceed 2.5 g/day) as a single daily dose for 7 days; in severe infections, repeat course after a 1-week interval

Roundworm eradication: Oral: 3.5 g/day for 2 days (in severe infections, repeat course, after a 1-week interval)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Pinworm eradication: Oral: Children: 65 mg/kg/day (not to exceed 2.5 g/day) as a single daily dose for 7 days; in severe infections, repeat course after a 1-week interval

Roundworm eradication: Oral: Children: 75 mg/kg/day as a single daily dose for 2 days; maximum: 3.5 g/day

ContraindicationsHypersensitivity to piperazine or any component of the formulation; seizure disorders; liver or kidney impairment

Warnings/Precautions

Disease-related concerns:

- Anemia: Use with caution in patients with anemia.

- Malnutrition: Use with caution in patients with malnutrition.

Other warnings/precautions:

- Prolonged use: Avoid prolonged use especially in children.

Geriatric ConsiderationsNot a drug of choice. Monitor closely in the elderly.

Pregnancy Risk FactorB

Adverse Reactions<1%: Bronchospasms, diarrhea, dizziness, EEG changes, headache, hemolytic anemia, hypersensitivity reactions, nausea, seizure, vertigo, visual impairment, vomiting, weakness

Drug Interactions

Aminoquinolines (Antimalarial): May decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

Monitoring ParametersStool exam for worms and ova

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Piperazine citrate is available from Panorama Pharmacy (1-800-247-9767).

Generic AvailableYes

Mechanism of ActionCauses muscle paralysis of the roundworm by blocking the effects of acetylcholine at the neuromuscular junction

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Time to peak, serum: 1 hour

Excretion: Urine (as unchanged drug and metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause seizures; use caution with high-dose clozapine

Index TermsPiperazine Citrate

Pipotiazine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(pip oh TYE a zeen)

Canadian Brand NamesPiportil® L_4

Pharmacologic CategoryAntipsychotic Agent, Typical, Phenothiazine, Piperidine

Use: Labeled IndicationsManagement of schizophrenia

Dosing: Adults**Schizophrenia (maintenance treatment):** I.M.: Initial (dosage must be individualized): 50-100 mg; may be increased in 25 mg increments every 2-3 weeks. Optimal dosage and interval must be determined by individual response. Usual maintenance dose: 75-150 mg every 4 weeks; range: 25-250 mg every 3-4 weeks. A lower dose at a shorter interval (eg, every 3 weeks) may be preferred to higher doses every 4 weeks.

Dosing: Elderly≥50 years: Initial dosage <50 mg is recommended.

Administration: I.M.Administer using at least a 21-gauge needle for injection.

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to pipotiazine, phenothiazine derivatives, or any component of the formulation (cross-reactivity between phenothiazines may occur); severe CNS depression; subcortical brain damage; hepatic or renal dysfunction; circulatory collapse; severe hypotension; severely depressed patients; high doses of hypnotics; bone marrow suppression; blood dyscrasias; coma; pheochromocytoma

Other piperidine phenothiazines (ie, thioridazine) are contraindicated for use in combination with other drugs that are known to prolong the QT_c interval; in patients with congenital long QT syndrome or a history of cardiac arrhythmias. In addition, these drugs are contraindicated with concurrent use with medications that inhibit the metabolism of phenothiazines (fluoxetine, paroxetine, fluvoxamine, propranolol, pindolol), and in patients known to have genetic defect leading to reduced levels of activity of CYP2D6. The metabolism and adverse effect profile of pipotiazine have not been adequately characterized to evaluate whether these contraindications also apply to this drug. They are not labeled contraindications (per Canadian product monograph).

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines); relative risk with pericyazine has not been established, although rare cases of QT_c prolongation have been reported.
- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems.
- Blood dyscrasias: Check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.
- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).
- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia.
- Neuroleptic malignant syndrome (NMS): May be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Pigmentary retinopathy: Prolonged therapy may cause pigmentary retinopathy, corneal deposits, and/or changes in skin pigmentation.
- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Depot injections: Adverse effects of depot injections may be prolonged.

- Sesame oil: Some product may contain sesame oil; use with caution in patients with known allergy to sesame oil or similar compounds.

Pregnancy ConsiderationsSafety and efficacy in pregnant women have not been established.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac arrest, ECG changes, edema, hypotension, QT_c prolongation, syncope, tachycardia

Central nervous system: Agitation, anxiety, bizarre dreams, cerebral edema, depression, dizziness, drowsiness, EEG changes, excitement, extrapyramidal symptoms (akathisia, dyskinesia, dystonia, hyper-reflexia, oculogyric crisis, opisthotonos, pseudoparkinsonism, rigidity, sialorrhea, tremor), fatigue, fever, headache, insomnia, paradoxical psychosis, restlessness, seizure, sleep disturbance, tardive dyskinesia

Dermatologic: Angioedema, eczema, epithelial keratopathy erythema, exfoliative dermatitis, dermatitis, photosensitivity, pruritus, rash, seborrhea, skin pigmentation (prolonged therapy), urticaria

Endocrine & metabolic: Anorexia, appetite increased, galactorrhea, gynecomastia, libido (changes in), menstrual irregularities, thirst, weight changes

Gastrointestinal: Adynamic ileus, cholestasis, constipation, fecal impaction, jaundice nausea, salivation, vomiting, xerostomia

Genitourinary: Bladder paralysis, impotence, incontinence, polyuria, urinary retention

Hematologic: Agranulocytosis, anemia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia

Ocular: Blurred vision, corneal deposits (prolonged therapy), glaucoma, lenticular deposits, pigmentary retinopathy (prolonged therapy)

Respiratory: Nasal congestion, pneumonia, pneumonitis

Miscellaneous: Diaphoresis iincreased, lupus-like syndrome

Metabolism/Transport EffectsNo published data on CYP metabolism. Based on structural analysis, pipotiazine may be a substrate of CYP2D6 and 3A4.
Drug Interactions

Analgesics (Opioid): Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Antimalarial Agents: May increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Beta-Blockers: Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, valerian, St John's wort, gotu kola (may increase CNS depression). Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsPhenothiazines have been reported to cause false positive pregnancy tests.

Monitoring ParametersVital signs; serum potassium and magnesium, lipid profile evaluation of renal and liver function tests (long-term therapy), fasting blood glucose/Hgb A_{1c}; waist circumference, BMI; mental status, abnormal involuntary movement scale (AIMS); periodic eye exam

Based on experience with other piperidine phenothiazines: consider baseline and periodic ECG, do not initiate if QT_c >450 msec

Monitoring: Lab TestsVital signs; serum potassium and magnesium, lipid profile, fasting blood glucose/Hgb A_{1c}; evaluation of renal and liver function tests (long-term therapy); BMI; periodic eye exam

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, oil:

Piportil® L_4: 25 mg/mL (1 mL) [contains sesame oil]; 50 mg/mL (1 mL, 2 mL) [contains sesame oil]

Generic AvailableNo

ManufacturerAventis Pharma (Canada)

Mechanism of ActionBlocks postsynaptic mesolimbic dopaminergic receptors in the brain; depresses the release of hypothalamic and hypophyseal hormones. Relative to other piperidine phenothiazines, pipotiazine appears to be less sedating, with less potential to potentiate other CNS depressants, and may possess a lower propensity to cause hypotension. However, it has a relatively high propensity for cause extrapyramidal reactions.

Pharmacodynamics/Kinetics

Onset of action: I.M.: 2-3 days

Duration: 3-6 weeks

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentCoadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Index TermsPipotiazine Palmitate

International Brand NamesLongum 4 (NL); Lonseren (ES); Piportil (BR, FR, HN, NO, NZ, PL); Piportil Depot (GB, ZA); Piportil L4 (AR, BR, CN, CO, FR, MX, PE, PL, PY, UY)

Pirbuterol

English

English

Jump To Field (Select Field Name)

Pronunciation(peer BYOO ter ole)

U.S. Brand NamesMaxair™ Autohaler™

Pharmacologic CategoryBeta$_2$ Agonist

Use: Labeled IndicationsPrevention and treatment of reversible bronchospasm including asthma

Dosing: Adults**Bronchospasm:** Inhalation: 2 inhalations every 4-6 hours for prevention; 2 inhalations at an interval of at least 1-3 minutes, followed by a third inhalation in treatment of bronchospasm, not to exceed 12 inhalations/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥12 years: Refer to adult dosing.

Administration: InhalationShake inhaler well before use.

StorageStore between 15°C and 30°C (59°F and 86°F).

ContraindicationsHypersensitivity to pirbuterol, albuterol, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.
- Serious effects/fatalities: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

Disease-related concerns:

- Asthma: Appropriate use: Optimize anti-inflammatory treatment before initiating maintenance treatment with albuterol. Do not use as a component of chronic therapy without an anti-inflammatory agent. Only the mildest forms of asthma (Step 1 and/or exercise-induced) would not require concurrent use based upon asthma guidelines.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia or hypertension or heart failure); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias.
- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.
- Glaucoma: Use with caution in patients with glaucoma; may elevate intraocular pressure.
- Hyperthyroidism: Use with caution in hyperthyroidism; may stimulate thyroid activity.
- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$-agonists may decrease serum potassium.
- Seizures: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Patient information: Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use may indicate deterioration of asthma, and treatment must not be delayed. All patients should utilize a spacer device when using a metered-dose inhaler.

Geriatric ConsiderationsElderly patients may find it beneficial to utilize a spacer device when using a metered dose inhaler. Difficulty in using the inhaler often limits its effectiveness. The Maxair™ Autohaler™ may be easier for the elderly to use.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse Reactions

>10%:

Central nervous system: Nervousness (7%)

Endocrine & metabolic: Serum glucose increased, serum potassium decreased

Neuromuscular & skeletal: Trembling (6%)

1% to 10%:

Cardiovascular: Palpitation (2%), tachycardia (1%)

Central nervous system: Headache (2%), dizziness (1%)

Gastrointestinal: Nausea (2%)

Respiratory: Cough (1%)

<1%: Abdominal pain/cramps, alopecia, anxiety, bruising, chest pain, confusion, depression, diarrhea, dry mouth, edema, flushing, glossitis, hyperkinesia, hypokalemia, hypotension, insomnia, pruritus, rash, skipped beats, smell/taste changes, sore throat, stomatitis, syncope, vomiting, weakness, numbness in extremities, weight gain

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Monitoring ParametersRespiratory rate; FEV$_1$, peak flow, and/or other pulmonary function tests; blood pressure, heart rate; CNS stimulation; serum glucose, serum potassium

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. For inpatient care, monitor vital signs and lung sounds prior to and periodically during therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsFEV$_1$, peak flow, and/or other pulmonary function tests; serum potassium, serum glucose (in selected patients)

Patient EducationUse exactly as directed. Do not use more often than recommended. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nervousness, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth or stomach upset (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). If you have diabetes, check blood sugar; blood glucose levels may be increased. Report unresolved GI upset; dizziness or fatigue; vision changes; chest pain, rapid heartbeat, or palpitations; nervousness or insomnia; muscle cramping or tremor; or unusual cough. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Aerosol: Store canister upside down; do not freeze. Shake canister before using. Sit when using medication. Close eyes when administering pirbuterol to avoid spray getting into eyes. Exhale slowly and completely through nose; inhale deeply through mouth while administering aerosol. Hold breath for 5-10 seconds after inhalation. Wait at least 1 full minute between inhalations. Wash mouthpiece between use. If more than one inhalation medication is used, use bronchodilator first and wait 5 minutes between medications

Maxair™ Autohaler™: Hold upright. Raise lever so that it stays up and snaps into place. Shake well. Exhale. Seal lips tightly around mouthpiece, inhale deeply. A "click" will be heard and you will feel a soft puff when the medication has been triggered. Continue to take a full, deep breath. Remove inhaler from mouth, hold breath for 10 seconds, then exhale slowly. **Note:** A test-fire slide has been added to the bottom of the Autohaler™ actuator/mouthpiece. The inhaler should be primed prior to using for the first time or if it has not been used in 48 hours. To prime, remove mouthpiece; point mouthpiece away from yourself or others, and push the lever so that it stays up. Push the white test-fire slide located on the bottom of the mouthpiece to release the priming spray. In order to release a second priming spray, push lever to "down" position, then repeat steps. When two priming sprays have been done, return lever to "down" position.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol for oral inhalation, as acetate:

Maxair™ Autohaler™: 200 mcg/actuation (14 g) [400 actuations; contains chlorofluorocarbons]

Generic AvailableNo

Manufacturer3M Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Aerosol (Maxair Autohaler)

200 mcg/INH (14): $115.99

Mechanism of ActionPirbuterol is a beta$_2$-adrenergic agonist with a similar structure to albuterol, specifically a pyridine ring has been substituted for the benzene ring in albuterol. The increased beta$_2$ selectivity of pirbuterol results from the substitution of a tertiary butyl group on the nitrogen of the side chain, which additionally imparts resistance of pirbuterol to degradation by monoamine oxidase and provides a lengthened duration of action in comparison to the less selective previous beta-agonist agents.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Therapeutic: Oral: 2-3 hours with peak serum concentration of 6.2-9.8 mcg/L; Inhalation: 0.5-1 hour

Half-life elimination: 2-3 hours

Metabolism: Hepatic

Excretion: Urine (10% as unchanged drug)

Related Information

- Bronchodilators
- Inhalant Agents

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste changes.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Nervousness and restlessness are common; may cause dizziness; may rarely cause insomnia

Mental Health: Effects on Psychiatric Treatment Concurrent use with TCAs and MAO inhibitors may results in increased toxicity; monitor

Cardiovascular Considerations Beta-agonists will induce increases in heart rate. This should be considered in patients with resting tachycardia. Because of the frequent coexistence of chronic obstructive lung disease and coronary artery disease, many patients are on simultaneous therapy with beta-agonists and beta-blockade. This combination should, for obvious reasons, be avoided. Frequent use of inhaled beta-agonists when used in patients with atrial fibrillation, may counteract pharmacologic interventions directed at rate control. Acute inhaled beta-agonists may be used to treat hyperkalemia in patients with renal failure.

Index Terms Pirbuterol Acetate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

International issues:

Flogene® [Brazil] may be confused with Florone® which is a brand name for diflorasone in the U.S.

Pronunciation(peer OKS i kam)

U.S. Brand NamesFeldene®

Canadian Brand NamesApo-Piroxicam®; Gen-Piroxicam; Novo-Pirocam; Nu-Pirox; Pexicam®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsSymptomatic treatment of acute and chronic rheumatoid arthritis and osteoarthritis

Use: Unlabeled/InvestigationalAnkylosing spondylitis

Dosing: Adults**Inflammation, rheumatoid arthritis:** Oral: 10-20 mg/day once daily; although associated with increase in GI adverse effects, doses >20 mg/day have been used (ie, 30-40 mg/day); maximum dose: 20 mg/day

Dosing: ElderlyRefer to adult dosing. **Note:** Some clinicians have used 10 mg every other day to initiate therapy in the elderly to help avoid side effects and produce therapeutic effect at minimal dose. Maximum dose: 20 mg/day.

Dosing: PediatricOral: Children (unlabeled use): 0.2-0.3 mg/kg/day once daily; maximum dose: 15 mg/day

Dosing: Renal ImpairmentNot recommended in patients with advanced renal disease.

Dosing: Hepatic ImpairmentReduced dose is necessary.

Dietary ConsiderationsMay be taken with food to decrease GI adverse effect.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to piroxicam, aspirin, other NSAIDs or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Serum sickness: A serum sickness-like reaction can rarely occur; watch for arthralgias, pruritus, fever, fatigue, and rash.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not generally effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

LactationEnters breast milk (small amounts)/not recommended (AAP rates "compatible")

Adverse Reactions

>10%:

Central nervous system: Dizziness

Dermatologic: Rash

Gastrointestinal: Abdominal cramps, heartburn, indigestion, nausea

1% to 10%:

Central nervous system: Headache, nervousness

Dermatologic: Itching

Endocrine & metabolic: Fluid retention

Gastrointestinal: Vomiting

Otic: Tinnitus

<1%: Acute renal failure, agranulocytosis, allergic rhinitis, anemia, angioedema, arrhythmia, aseptic meningitis, blurred vision, bone marrow suppression, confusion, CHF, conjunctivitis, cystitis, drowsiness, dry eyes, dyspnea, epistaxis, erythema multiforme, gastritis, GI ulceration, hallucinations, hearing decreased, hemolytic anemia, hepatitis, hot flashes, hypertension, insomnia, leukopenia, mental depression, peripheral neuropathy, photosensitivity, polydipsia, polyuria, Stevens-Johnson syndrome, tachycardia, thrombocytopenia, toxic amblyopia, toxic epidermal necrolysis, urticaria

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor); **Inhibits** CYP2C9 (strong)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor*

therapy

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Onset of effect may be delayed if piroxicam is taken with food.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsIncreased chloride (S), increased sodium (S), increased bleeding time

Monitoring ParametersOccult blood loss, hemoglobin, hematocrit, and periodic renal and hepatic function tests; periodic ophthalmologic exams with chronic use

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, GI effects, hepatotoxicity, ototoxicity) at beginning of therapy and periodically throughout therapy. Schedule ophthalmic evaluations for patients who develop eye complaints during long-term NSAID therapy. Advise patients with diabetes to use serum glucose testing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsOccult blood loss, hemoglobin, hematocrit, and periodic renal and hepatic function tests

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not break capsules. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience drowsiness, dizziness, or nervousness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia, nausea, vomiting, flatulence, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or fluid retention (weigh yourself weekly and report unusual weight gain [3-5 lb/week]). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report unusual swelling of extremities or unusual weight gain; breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; unusual fatigue; changes in urinary pattern (polyuria or anuria); skin rash or itching; or change in hearing or ringing in ears. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 10 mg, 20 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Feldene)

20 mg (30): $126.47

Capsules (Piroxicam)

10 mg (30): $11.99

20 mg (30): $14.99

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Analgesic: ~1 hour

Peak effect: 3-5 hours

Protein binding: 99%

Metabolism: Hepatic

Half-life elimination: 45-50 hours

Excretion: Primarily urine and feces (small amounts) as unchanged drug (5%) and metabolites

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause drowsiness, confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Pivampicillin

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(piv am pi SIL in)

Canadian Brand NamesPondocillin®

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of susceptible bacterial infections (nonbeta-lactamase-producing organisms); susceptible bacterial infections caused by streptococci, pneumococci, nonpenicillinase-producing staphylococci, *H. influenzae*, *N. gonorrhoeae*, *E. coli*, *P. mirabilis*, *Listeria*, *Salmonella*, *Shigella*, *Enterobacter*, and *Klebsiella*

Dosing: Adults

Bacterial infections: Oral: Usual dose: 500 mg (tablet) or 525 mg (suspension) twice daily; dosage may be doubled in severe infections

Gonococcal urethritis: Oral: 1.5 g as a single dose with 1 g probenecid concurrently

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Bacterial infections:** Oral suspension:

Infants <3 months: Use of pivampicillin in this age group should be avoided (see Warnings/Precautions on carnitine)

Infants 3-12 months: Dosage range: 40-60 mg/kg/day in 2 divided doses

Children ≤10 years: Dosage range: 25-35 mg/kg/day, not to exceed recommended daily adult dose of 500 mg twice daily

Children >10 years: Refer to adult dosing.

Alternatively: Children:

1-3 years: 175 mg twice daily

4-6 years: 262.5 mg twice daily

7-10 years: 350 mg twice daily

Dosing: Renal ImpairmentNo adjustment needed unless renal impairment is severe. Specific recommendations are not available.

Administration: OralMay be taken with or without food since absorption is virtually unaffected by taking with food; however, peak serum levels may be reduced and delayed when compared to doses given in fasting state; total bioavailability is not affected.

Storage

Suspension: Store powder at <25°C (77°F); reconstituted suspension may be stored for 7 days at room temperature and for 14 days under refrigeration.

Tablet: Store at <30°C (86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to ampicillin, pivalic acid, any component of the formulation, or other penicillins or cephalosporins; in secondary infections associated with mononucleosis or lymphatic leukemia; infections due to beta-lactamase-producing bacteria

Warnings/Precautions

Concerns related to adverse effects:

- Decreased carnitine: An increase in carnitine excretion in urine as conjugate with pivalic acid, and thus a decrease in serum carnitine levels, has been seen in patients. Carnitine production begins at birth and in healthy children is fully developed within a few months after birth.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Porphyria: Avoid use in patients with porphyria; use has been associated with acute attacks of porphyria and is considered unsafe in porphyric patients.

Concurrent drug therapy issues:

- Medications liberating pivalic acid: Concurrent treatment with medications liberating pivalic acid (eg, valproate) should be avoided.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 months of age; the suspension is not recommended for treatment of severe infections in children.

Pregnancy Risk FactorB (based on ampicillin rating in the U.S.)
Pregnancy ConsiderationsSafety has not been established; ampicillin component crosses the human placenta
LactationAmpicillin enters breast milk. It is not known if pivalic acid component is secreted into breast milk. Use caution.
Breast-Feeding ConsiderationsAdministration to a mother breast-feeding a child >3 months of age should weigh risks to infant versus benefit to mother (see Warnings/Precautions for precaution on carnitine).
Adverse ReactionsFrequency not defined; although some reactions may have not been reported with pivampicillin use, they are considered due to ampicillin component and events reported due to ampicillin, and therefore, may be expected to occur.

Central nervous system: Dizziness

Dermatologic: Erythema multiforme, exfoliative dermatitis, pruritus, rash (erythematous or macropapular), urticaria

Gastrointestinal: Black "hairy" tongue, diarrhea, enterocolitis, flatulence, glossitis, nausea, retrosternal pain, stomatitis, vomiting

Hematologic: Agranulocytosis, anemia, eosinophilia, leukopenia, thrombocytopenia, thrombocytopenic purpura

Hepatic: AST increased (transient)

Miscellaneous: Anaphylaxis

Drug Interactions

Allopurinol: May enhance the potential for allergic or hypersensitivity reactions to Pivampicillin. *Risk C: Monitor therapy*

Aminoglycosides: Penicillins may decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. *Risk D: Consider therapy modification*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Absorption unaffected by taking with food, however, peak serum levels may be reduced and delayed.
Test InteractionsMay interfere with urinary glucose tests using cupric sulfate: some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.
Monitoring ParametersWith prolonged therapy, monitor renal, hepatic, and hematologic function periodically; observe signs and symptoms of anaphylaxis during first dose
Nursing: Physical Assessment/MonitoringAssess culture and sensitivity report and patient allergy history prior to starting therapy. Assess potential for interactions with other medications patient may be taking. Caution patients with diabetes about altered response to Clinitest®. Assess for therapeutic effectiveness and adverse reactions (eg, rash, gastrointestinal upset, anaphylaxis, opportunistic infection [fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge] and fatigue). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsWith prolonged therapy, monitor renal, hepatic, and hematologic function periodically
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take entire prescription, even if you are feeling better. Take at equal intervals around-the-clock. Tablets or suspension may be taken with or without food. Suspension may be stored for 7 days at room temperature or 14 days if refrigerated. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, drug may cause false test results with Clinitest® urine glucose monitoring; use of another type of glucose monitoring is preferable. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report immediately any rash; swelling of face, tongue, mouth, or throat; unusual or persistent diarrhea; vaginal itching, burning, or pain; unresolved vomiting or constipation; fever or chills; abdominal pain; jaundice; unusual bruising or bleeding; or if condition being treated worsens or does not improve by the time prescription is completed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Powder for oral suspension:

Pondocillin® [CAN]: 175 mg/5 mL (100 mL, 150 mL, 200 mL) [banana and vanilla flavors] not available in the U.S.]

Tablet:

Pondocillin® [CAN]: 500 mg [equivalent to 377 mg ampicillin] [not available in the U.S.]

Generic AvailableNo
Manufacturer

Leo Pharma Inc

Mechanism of ActionProdrug converted to microbiologically active component (ampicillin) which inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: Bile, blister, and tissue fluids; penetration into CSF occurs with inflamed meninges only, good only with inflammation (exceeds usual MICs). Normal meninges: NIL; Inflamed meninges: 5% to 10%

Protein binding: 20% as ampicillin

Metabolism: Pivampicillin is converted to ampicillin within 15 minutes of absorption

Bioavailability: Amounts in excess of 99% absorbed

Half-life elimination: Children and Adults: 1-1.8 hours

Time to peak, plasma: 1 hour

Excretion: Urine (>70% as ampicillin); pivalic acid is excreted in urine in form of labile conjugates with glycine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral candidiasis, black "hairy" tongue, glossitis, and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentAvoid use with valproic acid

Index TermsMK-191; Pivampicilin

International Brand NamesPondocillin (DK, NO)

Pizotifen

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(pi ZOE ti fen)

Canadian Brand NamesSandomigran DS®; Sandomigran®

Pharmacologic CategorySerotonin and Histamine Antagonist

Use: Labeled IndicationsMigraine prophylaxis

Dosing: Adults**Migraine prophylaxis:** Oral: Initial: 0.5 mg at bedtime; increase gradually to 0.5 mg 3 times/day. Usual dosage range: 1-6 mg/day.

Note: Therapeutic response may require several weeks of therapy. Do not discontinue abruptly (reduce gradually over 2-week period).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Migraine prophylaxis:** Oral: Children ≥12 years: Refer to adult dosing.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to pizotifen or any component of the formulation; concurrent use of MAO inhibitors; gastric outlet obstruction (pyloroduodenal obstruction, stenosing pyloric ulcer)

Warnings/Precautions

Concerns related to adverse effects:

- Anticholinergic effects: Although anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention) are limited; use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Use with caution in patients intolerant to anticholinergic agents, including tricyclic antidepressants, phenothiazines, or cyproheptadine.

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Migraine attacks: Not for use in acute treatment of migraine attacks.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Obesity: Use with caution in obese patients.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Abrupt discontinuation: Avoid abrupt discontinuation; taper dosage over 2 weeks prior to discontinuation.

- Response to therapy: Therapeutic response may require several weeks of therapy.

- Tolerance: May develop in some patients; consider drug-free period after several months of treatment.

Pregnancy Risk FactorNot available

Pregnancy ConsiderationsUse only if potential benefit to the mother outweighs possible risk to the fetus.

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, hypotension

Central nervous system: Drowsiness, dizziness, headache, fatigue, confusion, depression, nervousness

Endocrine & metabolic: Increased appetite, weight gain

Gastrointestinal: Nausea, xerostomia, epigastric distress

Genitourinary: Impotence

Neuromuscular & skeletal: Weakness, muscle pain

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersHepatic function tests (prolonged use)

Monitoring: Lab TestsHepatic function tests (prolonged use)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Sandomigran® [CAN]: 0.5 mg [pizotifen malate 0.73 mg]

Tablet, double strength:

Sandomigran® DS [CAN]: 1 mg [pizotifen malate 1.46 mg]

Generic AvailableNo

ManufacturerNovartis (Canada)

Mechanism of ActionSerotonin and histamine antagonist; mechanism of action in migraine prophylaxis has not been fully elucidated

Pharmacodynamics/Kinetics

Onset of action: May require several weeks of therapy

Half-life elimination: 26 hours

Time to peak: 5-7 hours

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsPizotifen Malate

Plasma Protein Fraction

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(PLAS mah PROE teen FRAK shun)
U.S. Brand NamesPlasmanate®
Pharmacologic CategoryBlood Product Derivative
Use: Labeled IndicationsPlasma volume expansion and maintenance of cardiac output in the treatment of certain types of shock or impending shock
Dosing: Adults**Volume expansion:** I.V.: Usual minimum dose: 250-500 mL; adjust dose based on response
Dosing: ElderlyRefer to adult dosing.
Administration: I.V.

For I.V. administration. Administration should begin within 4 hours after entering the container; rapid infusion may cause vascular overload. Hypotension may occur when administered at rates >10 mL/minute; decrease rate of infusion if hypotension occurs

Dietary ConsiderationsInjection solution contains sodium 145 mEq/L and potassium 0.25 mEq/L.
Storage

Store at room temperature ≤30°C (≤86°F). Do not freeze. Do not use if solution is turbid or has been frozen. Administration should begin within 4 hours of opening container.

Contraindications

Hypersensitivity to plasma protein fraction or any component of the formulation; patients on cardiopulmonary bypass; severe anemia; congestive heart failure; increased blood volume

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension: Rapid infusions may cause hypotension. Decrease or stop infusion if sudden hypotension occurs.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. May be useful for initial therapy of shock due to dehydration or infection.

Other warnings/precautions:

- Coagulation disorders: Plasma protein fraction does not contain coagulation factors and does not correct coagulation disorders.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, flushing, hypotension (related to rate of infusion)

Central nervous system: Headache

Dermatologic: Urticaria

Gastrointestinal: Nausea

Neuromuscular & skeletal: Back pain

Respiratory: Pulmonary edema

Drug InteractionsThere are no known significant interactions.
Monitoring Parameters

Blood pressure, pulse, pulmonary exam

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [human; preservative free]:

Plasmanate®: 5% (50 mL, 250 mL) [contains human albumin ~88%, sodium 145 mEq/L and potassium 0.25 mEq/L]

Generic AvailableNo

Plerixafor

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(pler IX a fore)
U.S. Brand NamesMozobil™
Pharmacologic CategoryHematopoietic Stem Cell Mobilizer
Use: Labeled IndicationsMobilization of hematopoietic stem cells (HSC) for collection and subsequent autologous transplantation (in combination with G-CSF) in patients with non-Hodgkin’s lymphoma (NHL) and multiple myeloma (MM)
Dosing: Adults**Note:** Dosing is based on actual body weight. Begin plerixafor after patient has received G-CSF 10 mcg/kg once daily for 4 days; plerixafor, G-CSF and apheresis should be continued daily until sufficient cell collection up to a maximum of 4 days.

HSC mobilization: SubQ: 0.24 mg/kg once daily ~11 hours prior to apheresis for up to 4 consecutive days; maximum dose: 40 mg/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment
Cl_{cr} >50 mL/minute: No adjustment required.

Cl_{cr} ≤50 mL/minute: 0.16 mg/kg; maximum dose: 27 mg/day.

Hemodialysis: Insufficient information for dosing recommendation

Administration: I.V. DetailpH: 6-7.5
Administration: OtherAdminister subcutaneously, ~11 hours prior to initiation of apheresis. In some clinical trials, plerixafor administration began in the evening prior to apheresis. (G-CSF was begun on day 1, plerixafor initiated in the evening on day 4 and apheresis in the morning on day 5; with G-CSF, plerixafor and apheresis then continued daily until sufficient cell collection for autologous transplant.)
StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). The manufacturer recommends discarding unused drug remaining in the vial after use.
ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.
Warnings/Precautions

Concerns related to adverse effects:

- Leukocytosis: Increases circulating leukocytes when used in conjunction with G-CSF; monitor WBC. Use with caution in patients with neutrophil count >50,000/mm^3.
- Thrombocytopenia: Has been observed with use; monitor platelet count.

Disease-related concerns:

- Leukemia: Not intended for mobilization in patients with leukemia; may contaminate apheresis product by mobilizing leukemic cells.
- Renal impairment: Primary route of elimination is urinary; dosage reduction is recommended in patients with moderate-severe renal impairment (Cl_{cr} ≤50 mL/minute).

Concurrent drug therapy issues:

- G-CSF: Splenomegaly and splenic rupture have been reported (rarely) with G-CSF use; instruct patients to report left upper quadrant pain or scapular/shoulder tip pain; promptly evaluate in any patient who report these.
- Nephrotoxic drugs: Medications that may reduce renal function or compete for active tubular secretion may increase serum concentrations of plerixafor.

Special populations:

- Obese patients: Use has not been studied in patients weighing >175% of ideal body weight.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Tumor cell mobilization: When used in combination with G-CSF, tumor cells released from marrow could be collected in leukapheresis product; potential effect of tumor cell reinfusion is unknown.

Pregnancy Risk FactorD
Pregnancy ConsiderationsAdverse effects (including fetal mortality, decreased fetal weights, and teratogenicity) have been reported in animal studies. May cause fetal harm if administered to pregnant women. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should use effective contraceptive measures to avoid becoming pregnant during treatment.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse ReactionsAdverse reactions reported with G-CSF combination therapy.

>10%:

Central nervous system: Fatigue (27%), headache (22%), dizziness (11%)

Gastrointestinal: Diarrhea (37%), nausea (34%)

Local: Injection site reactions (34%, including erythema, hematoma, hemorrhage, induration, inflammation, irritation, pain, paresthesia, pruritus, rash, swelling, urticaria)

Neuromuscular & skeletal: Arthralgia (13%)

5% to 10%:

Central nervous system: Insomnia (7%)

Gastrointestinal: Vomiting (10%), flatulence (7%)

<5%, postmarketing, and/or case reports: Abdominal discomfort, abdominal distension, abdominal pain, constipation, diaphoresis, dyspepsia, dyspnea, erythema, hypesthesia (oral), hypoxia, leukocytes increased, malaise, musculoskeletal pain, orthostatic hypotension, periorbital swelling, syncope, thrombocytopenia, urticaria, vasovagal reaction, xerostomia

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersCBC with differential and platelets

Monitoring: Lab TestsCBC with differential and platelets

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Mozobil™: 20 mg/mL (1.2 mL)

Generic AvailableNo

ManufacturerGenzyme Corporation

Mechanism of ActionReversibly inhibits binding of stromal cell-derived factor-1-alpha (SDF-1α), expressed on bone marrow stromal cells, to the CXC chemokine receptor 4 (CXCR4), resulting in mobilization of hematopoietic stem and progenitor cells from bone marrow into peripheral blood. Plerixafor used in combination with G-CSF results in synergistic increase in CD34+ cell mobilization. Mobilized CD34+ cells are capable of engrafting with extended repopulating capacity.

Pharmacodynamics/Kinetics

Onset of action: Peak CD34+ mobilization: Plerixafor monotherapy: 6-9 hours after administration; Plerixafor + G-CSF: 10-14 hours

Duration: WBC counts return toward baseline at ~24 after administration

Absorption: SubQ: Rapid

Distribution: 0.3L/kg; primarily to extravascular fluid space

Protein binding: ≤58%

Metabolism: Not metabolized

Half-life elimination: Terminal: 3-6 hours

Time to peak, plasma: SubQ: 30-60 minutes

Excretion: Urine (~70%; as parent drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue, dizziness, and headache are common; may cause insomnia

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects

Index TermsAMD3100; LM3100

Medication Safety Issues

Sound-alike/look-alike issues:

Prevnar® may be confused with PREVEN®

Pronunciation(noo moe KOK al KON ju gate vak SEEN, seven vay lent)
U.S. Brand NamesPrevnar®
Canadian Brand NamesPrevnar®
Pharmacologic CategoryVaccine, Inactivated (Bacterial)
Use: Labeled Indications

Immunization of infants and toddlers against *Streptococcus pneumoniae* infection caused by serotypes included in the vaccine

Immunization of infant and toddlers against otitis media caused by serotypes included in the vaccine

Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for the following:

All children 2-23 months

Children ≥2-59 months with cochlear implants

Children ages 24-59 months with: Sickle cell disease (including other sickle cell hemoglobinopathies, asplenia, splenic dysfunction), HIV infection, immunocompromising conditions (congenital immunodeficiencies excluding chronic granulomatous disease, renal failure, nephrotic syndrome, diseases associated with immunosuppressive or radiation therapy, solid organ transplant), chronic illnesses (cardiac disease, cerebrospinal fluid leaks, diabetes mellitus, pulmonary disease excluding asthma unless on high dose corticosteroids)

Consider use in all children 24-59 months with priority given to:

Children 24-35 months

Children 24-59 months who are of Alaska native, American Indian, or African-American descent

Children 24-59 months who attend group day care centers

Dosing: AdultsDosing established for infants and toddlers
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Immunization: Infants: 2-6 months: I.M.: 0.5 mL at approximately 2-month intervals for 3 consecutive doses, followed by a fourth dose of 0.5 mL at 12-15 months of age; first dose may be given as young as 6 weeks of age, but is typically given at 2 months of age. In case of a moderate shortage of vaccine, defer the fourth dose until shortage is resolved; in case of a severe shortage of vaccine, defer third and fourth doses until shortage is resolved.

Previously Unvaccinated Older Infants and Children: I.M.:

7-11 months: 0.5 mL for a total of 3 doses; 2 doses at least 4 weeks apart, followed by a third dose after the 1-year birthday (12-15 months), separated from the second dose by at least 2 months. In case of a severe shortage of vaccine, defer the third dose until shortage is resolved.

12-23 months: 0.5 mL for a total of 2 doses, separated by at least 2 months. In case of a severe shortage of vaccine, defer the second dose until shortage is resolved.

24-59 months:

Healthy Children: 0.5 mL as a single dose. In case of a severe shortage of vaccine, defer dosing until shortage is resolved.

Children with sickle cell disease, asplenia, HIV infection, chronic illness or immunocompromising conditions: 0.5 mL for a total of 2 doses, separated by 2 months

Previously Vaccinated with PPSV (ACIP recommendations): I.M.: Children 24-59 months of age at high risk for pneumococcal disease but have already received the PPSV may benefit from the immunologic response induced by PCV. Suggested dosing: Starting ≥2 months after last PPSV dose: One dose of PCV, followed by a second dose ≥2 months later.

Previously Vaccinated with PCV and with a lapse in vaccine administration (ACIP recommendations) : I.M.;

7-11 months: Previously received 1 or 2 doses PCV: 0.5 mL dose at 7-11 months of age, followed by a second dose ≥2 months later at 12-15 months of age

12-23 months:

Previously received 1 dose before 12 months of age: 0.5 mL dose, followed by a second dose ≥2 months later

Previously received 2 doses before age 12 months: 0.5 mL dose ≥2 months after the most recent dose

24-59 months: Any incomplete schedule: 0.5 mL as a single dose; **Note:** Patients with chronic diseases or immunosuppressing conditions should receive 2 doses ≥2 months apart

Administration: I.M.Shake well prior to use. Administer I.M. (deltoid muscle for toddlers and young children or lateral midthigh in infants). Do not inject I.V.; avoid intradermal route.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

PCV with other inactivated vaccines: May be given simultaneously or at any interval between doses.

PCV with live vaccines: May be given simultaneously or at any interval between doses

Vaccine administration with antibody-containing products: PCV and antibody-containing products may be given simultaneously at different sites or at any interval between doses. Examples of antibody containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore refrigerated at 2°C to 8°C (36°F to 46°F); do not freeze.

ContraindicationsHypersensitivity to pneumococcal vaccine or any component of the formulation, including diphtheria toxoid

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute severe febrile illness; may administer to patients with mild acute illness (with or without fever).

- Asplenia: Use of pneumococcal conjugate vaccine does not replace use of the 23-valent pneumococcal polysaccharide vaccine in children ≥24 months of age with asplenia.

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

- Chronic illness: Use of pneumococcal conjugate vaccine does not replace use of the 23-valent pneumococcal polysaccharide vaccine in children ≥24 months of age with chronic illness.

- HIV: Use of pneumococcal conjugate vaccine does not replace use of the 23-valent pneumococcal polysaccharide vaccine in children ≥24 months of age with HIV infection.

- Pneumococcal infections: Not to be used to treat pneumococcal infections or to provide immunity against diphtheria.

- Seizure disorders: Febrile seizures have been reported (rare). Antipyretics should be administered at the time of vaccination to patients at risk for seizures to reduce the risk of postvaccination fever

- Sickle cell disease: Use of pneumococcal conjugate vaccine does not replace use of the 23-valent pneumococcal polysaccharide vaccine in children ≥24 months of age with sickle cell disease.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination. Use of pneumococcal conjugate vaccine does not replace use of the 23-valent pneumococcal polysaccharide vaccine in children ≥24 months of age who are immunocompromised.

- Pediatrics: Safety and efficacy have not been established in children <6 weeks or ≥10 years of age.

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.

Pregnancy Risk FactorC

Pregnancy Considerations

Reproduction studies have not been conducted. This product is indicated for use in infants and toddlers.

Lactation

Excretion in breast milk unknown/not recommended

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%:

Central nervous system: Fever, irritability, drowsiness, restlessness

Dermatologic: Erythema

Gastrointestinal: Decreased appetite, vomiting, diarrhea

Local: Induration, tenderness, nodule

1% to 10%: Dermatologic: Rash

Postmarketing and/or case reports: Anaphylactic reaction, anaphylactoid reaction, angioneurotic edema, apnea, bronchospasm, crying, dyspnea, erythema multiforme, facial edema, febrile seizure, hypersensitivity reaction, injection site reaction (eg, dermatitis, lymphadenopathy, pruritus, urticaria), shock

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Monitoring ParametersMonitor for syncope for ≥15 minutes following vaccination.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension:

Prevnar®: 2 mcg of each capsular saccharide for serotypes 4, 9V, 14, 18C, 19F, and 23F, and 4 mcg of serotype 6B [bound to diphtheria CRM$_{197}$ protein ~20 mcg] per 0.5 mL (0.5 mL) [contains aluminum, natural rubber/natural latex in packaging, soy, and yeast]

Generic AvailableNo

Mechanism of ActionPromotes active immunization against invasive disease caused by *S. pneumoniae* capsular serotypes 4, 6B, 9V, 14, 18C, 19F, and 23F, all which are individually conjugated to CRM197 protein

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title and address be entered into the patient's permanent medical record.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusIrritability, drowsiness, and restlessness are common

Mental Health: Effects on Psychiatric TreatmentMay lessen the effects of anxiolytics

Index TermsDiphtheria CRM$_{197}$ Protein; PCV; PCV7; Pneumococcal 7-Valent Conjugate Vaccine

U.S. Brand NamesPneumovax® 23

Canadian Brand NamesPneumo 23™; Pneumovax® 23

Pharmacologic CategoryVaccine, Inactivated (Bacterial)

Use: Labeled IndicationsImmunization against pneumococcal disease caused by serotypes included in the vaccine. Use is recommended for the following:

Immunocompetent individuals:

Routine vaccination for persons ≥50 years of age

Persons ≥2 years with the following chronic conditions: cardiovascular disease, pulmonary disease, diabetes mellitus, liver disease

Persons ≥2 years with alcoholism, cerebrospinal fluid leaks, functional or anatomic asplenia

Persons ≥2 years in special living environments or social settings

Adults 19-64 years who smoke cigarettes

Immunocompromised individuals: Persons ≥2 years with HIV infection, leukemia, lymphoma, Hodgkin's disease, multiple myeloma, generalized malignancy, chronic renal failure, nephritic syndrome, chronic immunosuppressive therapy (including corticosteroids), persons who received an organ or bone marrow transplant

In addition, the Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for all immunocompetent persons ≥65 years of age and persons aged 2-64 years with cochlear implants. Routine vaccination is not recommended for Alaska Natives or American Indian persons unless they have underlying conditions which are indications for vaccination; in special situations, vaccination may be recommended when living in an area at increased risk of invasive pneumococcal disease.

Dosing: Adults**Immunization:** I.M., SubQ: 0.5 mL

Revaccination:

Immunocompetent individuals: Revaccination generally not recommended

Children ≥2 years and Adults at highest risk for infection: One revaccination ≥5 years after first dose of PPSV. May consider giving the revaccination dose ≥3 years after first dose of PPSV in children who will be ≤10 years of age at the time of revaccination. Patients at highest risk for infection include those with asplenia, sickle cell anemia, HIV infection, leukemia, lymphoma, Hodgkin's disease, multiple myeloma, generalized malignancy, chronic renal failure, nephrotic syndrome, conditions associated with immunosuppression, and patients on immunosuppressive therapy (including corticosteroids)

Elderly (≥65 years): One revaccination if ≥5 years after first dose of PPSV and if <65 years of age of initial vaccination.

Previously vaccinated with PCV vaccine: Children ≥2 years and Adults (ACIP recommendations):

With sickle cell disease, asplenia, immunocompromised or HIV infection: 0.5 mL at ≥2 years of age and ≥2 months after last dose of PCV; one revaccination with PPSV should be given ≥5 years for children >10 years of age and after 3-5 years for children ≤10 years of age; revaccination should not be administered <3 years after the previous PPSV dose

With chronic illness: 0.5 mL at ≥2 years of age and ≥2 months after last dose of PCV; revaccination with PPSV is not recommended

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥2 years: Refer to adult dosing.

Administration: I.M.Do not inject I.V., avoid intradermal (may cause severe local reactions); administer SubQ or I.M. (deltoid muscle or lateral midthigh)

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends "it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection."

Administration with other vaccines:

PPSV with other inactivated vaccines: May be given simultaneously or at any interval between doses.

PPSV with live vaccines: May be given simultaneously or at any interval between doses

Vaccine administration with antibody-containing products: PPSV and antibody-containing products may be given simultaneously at different sites or at any interval between doses. Examples of antibody containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F).
ContraindicationsHypersensitivity to pneumococcal vaccine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute febrile illness.

- Cardiovascular disease: Use with caution in patients with severe cardiovascular where a systemic reaction may pose a significant risk.

- HIV: Patients with HIV should be vaccinated as soon as possible (following confirmation of the diagnosis).

- Respiratory disease: Use with caution in patients with severe pulmonary disease where a systemic reaction may pose a significant risk.

- Splenectomy: Patients who will undergo splenectomy should also be vaccinated 2 weeks prior to surgery, if possible.

- Thrombocytopenia purpura: May cause relapse in patients with stable idiopathic thrombocytopenia purpura.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist. If a person has not received any pneumococcal vaccine or if pneumococcal vaccination status is unknown, PPSV should be administered as indicated.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients; patients who will be receiving immunosuppressive therapy (including Hodgkin's disease, cancer chemotherapy, or transplantation) should be vaccinated at least 2 weeks prior to the initiation of therapy. Immune responses may be impaired for several months following intensive immunosuppressive therapy (up to 2 years in Hodgkin's disease patients).

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Geriatric ConsiderationsElderly have ~3 times the incidence of pneumococcal pneumonia than younger adults and 30% of all pneumococcal meningitis occurs in persons >50 years of age with a 20% mortality. Limited data on the elderly; however, elderly, compared to young adults, develop slightly lower antibody titers; provides 60% to 70% protection for bacterial pneumonia. 90% protection for pneumococcal pneumonia strains; 20% of the elderly with pneumococcal pneumonia have an associated bacteremia with a 17% to 40% fatality. All persons ≥65 years of age should receive the pneumococcal vaccine including previously unvaccinated persons and persons who have not been vaccinated within 5 years. All persons of unknown vaccination status should receive once dose of vaccine.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Vaccination should be considered in pregnant women at high risk for infection.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Frequency not defined.

Central nervous system: Chills, Guillain-Barré syndrome, fever ≤102˚F*, fever >102˚F, headache, malaise, pain, radiculoneuropathy, seizure (febrile)

Dermatologic: Angioneurotic edema, cellulitis, rash, urticaria

Gastrointestinal: Nausea, vomiting

Hematologic: Hemolytic anemia (in patients with other hematologic disorders), leukocytosis, thrombocytopenia (in patients with stabilized ITP)

Local: Injection site reaction* (erythema, induration, swelling, soreness, warmth); peripheral edema in injected extremity

Neuromuscular & skeletal: Arthralgia, arthritis, limb mobility decreased, myalgia, paresthesia, weakness

Miscellaneous: Anaphylactoid reaction, C-reactive protein increased, lymphadenitis, serum sickness

*Reactions most commonly reported in clinical trials.

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Monitoring ParametersMonitor for syncope for ≥15 minutes following vaccination.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Pneumovax® 23: 25 mcg each of 23 capsular polysaccharide isolates/0.5 mL (0.5 mL, 2.5 mL)

Generic AvailableNo
Mechanism of ActionAlthough there are more than 80 known pneumococcal capsular types, pneumococcal disease is mainly caused by only a few types of pneumococci. Pneumococcal vaccine contains capsular polysaccharides of 23 pneumococcal types of *Streptococcal pneumoniae* which represent at least 85% to 90% of pneumococcal disease isolates in the United States. The pneumococcal vaccine with 23 pneumococcal capsular polysaccharide types became available in 1983. The 23 capsular pneumococcal vaccine contains purified capsular polysaccharides of pneumococcal types 1, 2, 3, 4, 5, 6B, 7F, 8, 9N, 9V, 10A, 11A, 12F, 14, 15B, 17F, 18C, 19F, 19A, 20, 22F, 23F, and 33F. These are the main pneumococcal types associated with serious infections in the United States.

Canadian Brand NamesPodofilm®

Pharmacologic CategoryKeratolytic Agent

Use: Labeled IndicationsTopical treatment of benign growths including external genital and perianal warts, papillomas, fibroids; compound benzoin tincture generally is used as the medium for topical application

Dosing: Adults**Treatment of benign growths (warts, papillomas, fibroids):** Topical: 10% to 25% solution in compound benzoin tincture; apply drug to dry surface, use 1 drop at a time allowing drying between drops until area is covered. Total volume should be limited to <0.5 mL per treatment session.

Condylomata acuminatum: 25% solution is applied daily. Use a 10% solution when applied to or near mucous membranes.

Verrucae: 25% solution is applied 3-5 times/day directly to the wart.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: TopicalShake well before using. **Only to be applied by physician.** Solution should be washed off within 1-4 hours for genital and perianal warts and within 1-2 hours for accessible meatal warts. Use protective occlusive dressing around warts to prevent contact with unaffected skin. For external use only.

ContraindicationsNot to be used on birthmarks, moles, or warts with hair growth; cervical, urethral, oral warts; not to be used by patient with diabetes or patient with poor circulation; pregnancy

Warnings/Precautions

Dosage form specific issues:

- 25% solution: Should not be applied to or near mucous membranes.

Other warnings/precautions:

- Appropriate use: Use of large amounts of drug should be avoided. For external use only; avoid contact with the eyes as it can cause severe corneal damage; do not apply to moles, birthmarks, or unusual warts. To be applied by a physician only.

Pregnancy Risk FactorX

LactationEnters breast milk/contraindicated

Adverse Reactions

1% to 10%:

Dermatologic: Pruritus

Gastrointestinal: Nausea, vomiting, abdominal pain, diarrhea

<1%: Confusion, hallucinations, hepatotoxicity, lethargy, leukopenia, peripheral neuropathy, renal failure, thrombocytopenia

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/Monitoring**Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to sexually-active female patients unless capable of complying with contraceptive use. Breast-feeding is contraindicated.

Patient EducationCover with occlusive dressing to prevent contact with unaffected skin. Wash off medication as instructed by professional who applied the treatment. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, topical: 25% (15 mL) [in benzoin tincture]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Podocon)

25% (15): $84.49

Mechanism of ActionDirectly affects epithelial cell metabolism by arresting mitosis through binding to a protein subunit of spindle microtubules (tubulin)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment May rarely cause leukopenia, use caution with clozapine and carbamazepine

Poliovirus Vaccine (Inactivated)

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(POE lee oh VYE rus vak SEEN, in ak ti VAY ted)

U.S. Brand NamesIPOL®

Canadian Brand NamesIPOL®

Pharmacologic CategoryVaccine

Use: Labeled IndicationsActive immunization against poliomyelitis caused by poliovirus types 1, 2 and 3. Routine immunization of adults in the United States is generally not recommended. Adults with previous wild poliovirus disease, who have never been immunized, or those who are incompletely immunized may receive inactivated poliovirus vaccine if they fall into one of the following categories:

- Travelers to regions or countries where poliomyelitis is endemic or epidemic
- Healthcare workers in close contact with patients who may be excreting poliovirus
- Laboratory workers handling specimens that may contain poliovirus
- Members of communities or specific population groups with diseases caused by wild poliovirus
- Incompletely vaccinated or unvaccinated adults in a household or with other close contact with children receiving oral poliovirus (may be at increased risk of vaccine associated paralytic poliomyelitis)

Dosing: Adults**Immunization:** I.M., SubQ:

Previously unvaccinated: Two 0.5 mL doses administered at 1- to 2-month intervals, followed by a third dose 6-12 months later. If <3 months, but at least 2 months are available before protection is needed, 3 doses may be administered at least 1 month apart. If administration must be completed within 1-2 months, give 2 doses at least 1 month apart. If <1 month is available, give 1 dose.

Incompletely vaccinated: Adults with at least 1 previous dose of OPV, <3 doses of IPV, or a combination of OPV and IPV equaling <3 doses, administer at least one 0.5 mL dose of IPV. Additional doses to complete the series may be given if time permits.

Completely vaccinated: One 0.5 mL dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Immunization:** I.M., SubQ: Primary immunization: Administer three 0.5 mL doses, preferably 8 or more weeks apart at 2, 4, and 6-18 months of age. Booster dose: 0.5 mL at 4-6 years of age.

Administration: I.M.Administer to midlateral aspect of the thigh in infants and small children. Administer in the deltoid area to adults or older children.

Administration: I.V.Do not administer I.V.

Administration: OtherSubQ: Administer to midlateral aspect of the thigh in infants and small children. Administer in the deltoid area to adults or older children.

StorageStore under refrigeration 2°C to 8°C (35°F to 46°F); do not freeze.

ContraindicationsHypersensitivity to any component of the vaccine

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).
- Polio infection: Patients with prior clinical poliomyelitis or incomplete immunization with oral poliovirus vaccine (OPV) may receive inactivated poliovirus vaccine (IPV).

Concurrent drug therapy issues:

- Immune globulin: Immune response may be decreased in patients receiving immune globulin.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients; patients with HIV infection, severe combined immunodeficiency, hypogammaglobulinemia, agammaglobulinemia, or altered immunity (due to corticosteroids, alkylating agents, antimetabolites or radiation) may receive inactivated poliovirus vaccine (IPV).
- Pediatrics: Safety and efficacy have not been established in children <6 weeks of age.

Dosage form specific issues:

- 2-phenoxyethanol: Products may contain 2-phenoxyethanol.
- Calf serum protein: Products may contain calf serum protein.
- Formaldehyde: Products may contain formaldehyde.
- Latex: Packaging may contain natural latex rubber.
- Neomycin: Products may contain neomycin.
- Polymyxin B: Products may contain polymyxin B.
- Streptomycin: Products may contain streptomycin.

Geriatric ConsiderationsFor the elderly who cannot document a primary immunization series or at risk due to contact or travel, administer the initial series. Boosters may be necessary for travel since antibody titers may diminish with age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Although adverse effects of IPV have not been documented in pregnant women or their fetuses, vaccination of pregnant women should be avoided on theoretical grounds. Pregnant women at increased risk for infection and requiring immediate protection against polio may be administered the vaccine.

LactationExcretion into breast milk unknown/use caution

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Percentages noted with concomitant administration of DTP or DTaP vaccine and observed within 48 hours of injection.

>10%:

Central nervous system: Irritability (7% to 65%), tiredness (4% to 61%), fever ≥39°C (≤38%)

Gastrointestinal: Anorexia (1% to 17%)

Local: Injection Site: Tenderness (≤29%), pain (13%), swelling (≤11%)

1% to 10%:

Gastrointestinal: Vomiting (1% to 3%)

Local: Injection site: Erythema (≤3%), induration (1%)

Miscellaneous: Persistent crying (up to 1% reported within 72 hours)

Postmarketing and/or case reports: Guillain-Barré syndrome has been temporally related to another inactivated poliovirus vaccine

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension:

IPOL®: Type 1 poliovirus 40 D-antigen units, type 2 poliovirus 8 D-antigen units, and type 3 poliovirus 32 D-antigen units per 0.5 mL (0.5 mL, 5 mL) [contains 2-phenoxyethanol, formaldehyde, calf serum protein, neomycin (may have trace amounts), streptomycin (may have trace amounts), and polymyxin B (may have trace amounts)]

Generic AvailableNo

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

As the global eradication of poliomyelitis continues, the risk for importation of wild-type poliovirus into the United States decreases dramatically. To eliminate the risk for vaccine-associated paralytic poliomyelitis (VAPP), an all-IPV schedule is recommended for routine childhood vaccination in the United States. Oral poliovirus vaccine (OPV), is not commercially available in the United States, but has been stockpiled for use in the following special circumstances:

Mass vaccination campaigns to control outbreaks of paralytic polio

Unvaccinated children who will be traveling within 4 weeks to areas where polio is endemic or epidemic

Children of parents who do not accept the recommended number of vaccine injections; these children may receive OPV only for the third or fourth dose or both. In this situation, healthcare providers should administer OPV only after discussing the risk for VAPP with parents or caregivers.

Currently, the primary risk for paralytic polio in U.S. residents is through travel to countries where polio remains endemic or where polio outbreaks are occurring. Unvaccinated persons traveling to countries that use OPV should be aware of the risk caused by OPV and should consider polio vaccination prior to travel.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported

Poly-L-Lactic Acid

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(POL i el LAK tik AS id)
U.S. Brand NamesSculptra®
Pharmacologic CategoryCosmetic Agent, Implant
Use: Labeled IndicationsRestoration and/or correction of facial lipoatrophy in patients with HIV
Dosing: Adults **Lipoatrophy:** Intradermal or SubQ: ~0.05-0.2 mL per individual injection depending on technique used; ~20 injections may be needed per cheek. Treatment should be individualized. Separate treatments by ≥2 weeks. Typical course involves 3-6 treatments. Supplemental injections may be needed. Do not overfill contour deficiency. For patients with severe facial fat loss, the average treatment requires ~1 vial per cheek area per treatment.
Dosing: ElderlyRefer to adult dosing.
Administration: OtherFor injection into deep dermis or subcutaneous layer. Avoid intravenous injection. Administer using 26 gauge needle; do not bend needle. Massage treatment area periodically during session to evenly distribute.
StoragePrior to and following reconstitution, store at room temperature.
ReconstitutionSlowly add 3-5 mL SWFI to vial and allow to stand for 2 hours to hydrate. **Do not shake.** After 2 hours, agitate vial until a uniform suspension is formed. Use within 72 hours.
ContraindicationsHypersensitivity to poly-L-lactic acid or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: Patients should be instructed to limit exposure to excessive sunlight or UV lamps until any swelling or redness is resolved.

Concurrent drug therapy issues:

- Anticoagulants/antiplatelets: Use with caution in patients on anticoagulants or antiplatelet medications.

Special populations:

- Non-Caucasians: Safety and efficacy in non-Caucasians are limited.
- Pediatrics: Safety and efficacy have not been established in children.
- Women: Safety and efficacy are limited in women with HIV.

Other warnings/precautions:

- Administration: Avoid IV injection; may lead to occlusion, infarction, or embolism.
- Appropriate use: Not for use if skin inflammation or infection exists in or near the treatment area; control inflammation or infection before use. Avoid use with implants. Avoid overcorrection of contour deficit; improvement occurs over weeks of treatment. Safety and efficacy have not been established for use in the periorbital area.

Pregnancy ConsiderationsSafety for use during pregnancy has not been established.
Breast-Feeding ConsiderationsSafety for use during breast-feeding has not been established. HIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.
Adverse Reactions

>10%:

Dermatologic: Bruising (1% to 38%)

Hematologic: Hematoma (up to 28%)

Local: Injection site: Papules (6% to 52%), edema (3% to 17%)

Miscellaneous: Discomfort (up to 19%)

1% to 10%:

Central nervous system: Fever (<5%)

Local: erythema (up to 10%), injection site reactions (<5%)

Postmarketing/case reports: Allergic reaction, angioedema, brittle nails, colitis, ectropion, fatigue, hair breakage, hypersensitivity reaction, hypertrophy, joint aches, malaise, photosensitivity, Quicke's edema, rash, skin roughness, telangiectasia, visible nodules

Injection site reactions: Abscess, atrophy, discharge, fat atrophy, granuloma

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for suspension:

Sculptra®: Poly-L-lactic acid USP

Generic AvailableNo

ManufacturerDermik Laboratories

Mechanism of ActionPoly-L-lactic acid is an immunologically inert synthetic polymer. It increases dermal thickness by causing a local reaction leading to an increase in collagen deposits. It is eventually degraded and undergoes resorption.

Pharmacodynamics/Kinetics

Onset of action: Weeks to months for full effect of treatment

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue and malaise

Mental Health: Effects on Psychiatric TreatmentMay cause photosensitivity; monitor concurrent use with psychotropics that also cause photosensitivity

Dosing: PediatricConstipation or diarrhea: General dosing guidelines (OTC labeling): Oral:

Children 6-12 years: 625 mg calcium polycarbophil 1-4 times/day

Children ≥12 years: Refer to adult dosing.

Administration: OralPatient should drink adequate fluids (8 oz of water or other fluids) with each dose.

Dietary ConsiderationsFiberCon® contains calcium 122 mg/caplet. Fiber-Lax® contains calcium 170 mg/captab. Konsyl® Fiber contains calcium 125 mg/tablet.

Warnings/Precautions

Other warnings/precautions:

- Administration: Taking products without adequate fluid may cause it to swell and block throat or esophagus; use with caution in patients who have difficulty swallowing.

Geriatric ConsiderationsElderly may have insufficient fluid intake which may predispose them to fecal impaction and bowel obstruction. Bloating and flatulence may be a problem when used short-term. Use cautiously in patients with a history of bowel impaction/obstruction.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined: Gastrointestinal: Abdominal fullness

Drug Interactions

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Eltrombopag: Calcium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., calcium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet: Calcium polycarbophil 625 mg [equivalent to polycarbophil 500 mg]

FiberCon®: Calcium polycarbophil 625 mg [equivalent to polycarbophil 500 mg; contains calcium 122 mg/caplet]

Konsyl® Fiber: Calcium polycarbophil 625 mg [equivalent to polycarbophil 500 mg; contains calcium 125 mg/caplet]

Captab:

Fiber-Lax®: Calcium polycarbophil 625 mg [equivalent to polycarbophil 500 mg; contains calcium 170 mg/captab]

Tablet: Calcium polycarbophil 625 mg [equivalent to polycarbophil 500 mg]

Fiber-Tabs™: Calcium polycarbophil 625 mg [equivalent to polycarbophil 500 mg]

Tablet, chewable:

Equalactin®: Calcium polycarbophil 625 mg [equivalent to polycarbophil 500 mg; citrus flavor]

Generic AvailableYes

Mechanism of ActionRestoring a more normal moisture level and providing bulk in the patient's intestinal tract

Dental Health: Effects on Dental TreatmentOral medication should be given at least 1 hour prior to taking the bulk-producing laxative in order to prevent decreased absorption of medication.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Polyethylene Glycol 3350

Lexi-Drugs Online

Medication Safety Issues

Sound-alike/look-alike issues:

MiraLax™ may be confused with Mirapex®

International issues:

MiraLax™ may be confused with Murelax® which is a brand name for oxazepam in Australia

Pronunciation(pol i ETH i leen GLY kol 3350)
U.S. Brand NamesGlycoLax®; MiraLax® [OTC]
Pharmacologic CategoryLaxative, Osmotic
Use: Labeled IndicationsTreatment of occasional constipation in adults
Use: Unlabeled/InvestigationalTreatment of constipation in children
Dosing: Adults**Occasional constipation:** Oral: 17 g of powder (~1 heaping tablespoon) dissolved in 8 oz of water, once daily; do not use for >2 weeks.
Dosing: ElderlyRefer to adult dosing.
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F) before reconstitution.
ReconstitutionDissolve powder in 8 ounces of water, juice, cola, or tea.
ContraindicationsHypersensitivity to polyethylene glycol or any component of the formulation; gastrointestinal obstruction
Warnings/Precautions

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤16 years of age.

Other warnings/precautions:

- Appropriate use: Evaluate patients with symptoms of bowel obstruction (nausea, vomiting, abdominal pain or distension) prior to use. Not intended for use as a bowel evacuant prior to GI examination.

- Duration of therapy: Do not use for longer than 2 weeks; 2-4 days may be required to produce bowel movement.

Geriatric ConsiderationsElderly are more likely to show CNS signs of dehydration and electrolyte loss than younger adults. Therefore, monitor closely for fluid and electrolyte loss with chronic use.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted in animals or in humans.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Dermatologic: Urticaria

Gastrointestinal: Abdominal bloating, cramping, diarrhea, flatulence, nausea

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringAssess patient for symptoms of bowel obstruction prior to treatment. Instruct patient in appropriate use (not to be used for longer than 2 weeks), possible side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationFollow instructions exactly. Do not use for longer than prescribed. Mix one heaping tablespoon of powder in 8 ounces of water and drink immediately. May take 2-4 days to produce bowel movement. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. May cause some gastrointestinal discomfort (mild bloating, cramping, flatulence, nausea, diarrhea). Stop taking and report any signs of blood in urine or stool, excessive vomiting, or cramping. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Powder, for oral solution: PEG 3350 17 g/packet (12s); PEG 3350 255 g (14 oz); PEG 3350 527 g (26 oz)

GlycoLax®: PEG 3350 17 g/packet (14s) [DSC]; PEG 3350 255 g (16 oz) [DSC]; PEG 3350 527 g (24 oz)

MiraLax®: PEG 3350 17 g/packet (12s) [DSC]; PEG 3350 255 g (14 oz); PEG 3350 527 g (26 oz) [DSC]

Generic AvailableYes

Polyethylene Glycol-Electrolyte Solution and Bisacodyl

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(pol i ETH i leen GLY kol ee LEK troe lite soe LOO shun & bis a KOE dil)
U.S. Brand NamesHalfLytely® and Bisacodyl
Pharmacologic CategoryLaxative, Bowel Evacuant; Laxative, Stimulant
Use: Labeled IndicationsBowel cleansing prior to colonoscopy
Dosing: Adults**Bowel cleansing:** Oral:

Bisacodyl: 2 tablets as a single dose. After bowel movement or 6 hours (whichever occurs first), initiate polyethylene glycol-electrolyte solution

Polyethylene glycol-electrolyte solution: 8 ounces every 10 minutes until 2 L are consumed

Dosing: ElderlyRefer to adult dosing.
Administration: OralDo not chew or crush bisacodyl tablets. Rapidly drinking the polyethylene glycol-electrolyte solution is preferred to drinking small amount continuously. If severe bloating, distention, or abdominal pain occurs, administration should be slowed or temporarily discontinued until symptoms resolve.
Dietary ConsiderationsDrink only clear liquids during bowel preparation; after consuming the solution, avoid drinking large quantities of clear liquids until colonoscopy.
StoragePolyethylene glycol-electrolyte solution: Store at 15°C to 30°C (59°F to 86°F). When reconstituted, may refrigerate. Use within 48 hours.
ReconstitutionFill the container with water to the fill mark. Shake well.
ContraindicationsHypersensitivity to bisacodyl, polyethylene glycol or any component of the formulation, gastrointestinal obstruction, bowel perforation, toxic colitis, or toxic megacolon
Warnings/Precautions

Concerns related to adverse effects:

- Ischemic colitis: Cases of ischemic colitis have been reported; development of severe abdominal pain or rectal bleeding should prompt further evaluation.
- Seizures: Generalized tonic-clonic seizures have occurred in patients with no prior history of seizures when using the large volume (4 L) preparation. Seizures resolved with the correction of fluid and electrolyte abnormalities. Use caution in patients taking medications which increase the risk for electrolyte abnormalities (eg, diuretics) and/or patients with pre-existing electrolyte abnormalities. Evaluation of electrolytes pre- and post-colonoscopy is warranted in this population.

Disease-related concerns:

- Gastric retention: Use caution in patients with gastric retention.
- Ileus: Use caution in patients with ileus.
- Impaired gag reflux: Observe unconscious or semiconscious patients with impaired gag reflex or those who are otherwise prone to regurgitation or aspiration during administration.
- Renal impairment: Patients with impaired renal function who develop severe vomiting should be closely monitored including measurement of electrolytes.
- Ulcerative colitis: Use with caution in patients with severe ulcerative colitis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: No additional ingredients or flavors (other than the flavor packs provided) should be added to the polyethylene glycol-electrolyte solution.

Geriatric ConsiderationsStudies of this combination preparation drug included 28% of patients >65 years of age with 9.1% being >75 years. No differences in safety or efficacy were observed. No adjustments in dose are necessary.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproductive studies have not been conducted with this combination.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Gastrointestinal: Nausea (13%), fullness (11%)

Miscellaneous: Overall discomfort (14%)

1% to 10%: Gastrointestinal: Cramping (7%), vomiting (5%)

Postmarketing and/or case reports: Anaphylaxis, aspiration, asystole, dermatitis, dizziness, dyspnea, esophageal perforation, hypersensitivity, ischemic colitis, Mallory-Weiss syndrome, pulmonary edema, rhinorrhea, seizure (using the 4 L preparation), syncope, urticaria

Drug Interactions

Antacids: May diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Take clear liquid diet during bowel preparation; after consuming the solution, avoid drinking large quantities of clear liquids until colonoscopy.

Monitoring ParametersBowel movements; electrolytes, renal function

Nursing: Physical Assessment/MonitoringSee individual agent for Polyethylene Glycol-Electrolyte Solution.

Monitoring: Lab TestsElectrolytes, renal function

Patient EducationSee individual agent for Polyethylene Glycol-Electrolyte Solution.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Kit [each kit contains]:

HalfLytely® and Bisacodyl:

Powder for oral solution (HalfLytely®): PEG 3350 210 g, sodium bicarbonate 2.86 g, sodium chloride 5.6 g, potassium chloride 0.74 g (2000 mL) [sulfate-free; cherry, lemon-lime, orange flavor]

Tablet, delayed release (Bisacodyl): 5 mg (2s)

Generic AvailableNo

ManufacturerBraintree Laboratories, Inc

Pricing: U.S. (www.drugstore.com)

Kit (HalfLytely Bowel Prep)

5-210 mg-g (1): $57.77

Mechanism of ActionBisacodyl acts on the colonic mucosa to increase peristalsis throughout the large intestine. Polyethylene glycol-electrolyte solution induces catharsis through strong electrolyte and osmotic effects.

Pharmacodynamics/KineticsSee individual agents.

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Mental Health Comment

Oral medications should not be administered within 1 hour of start of therapy

Medication Safety Issues

Sound-alike/look-alike issues:

GoLYTELY® may be confused with NuLYTELY®

NuLYTELY® may be confused with GoLYTELY®

TriLyte® may be confused with TriLipix™

Pronunciation(pol i ETH i leen GLY kol ee LEK troe lite soe LOO shun)
U.S. Brand NamesColyte®; GoLYTELY®; MoviPrep®; NuLYTELY®; TriLyte®
Canadian Brand NamesColyte™; Klean-Prep®; PegLyte®
Pharmacologic CategoryLaxative, Osmotic
Use: Labeled IndicationsBowel cleansing prior to GI examination
Use: Unlabeled/InvestigationalWhole bowel irrigation (WBI) in the following toxic ingestions: Packets of illicit drugs (body packers, body stuffers), potentially toxic sustained-release or enteric-coated agents, substantial amounts of iron (AACT, 2004)
Dosing: Adults

Bowel cleansing prior to GI exam:

Oral:

CoLyte®, GoLYTELY®, NuLYTELY®, TriLyte®: 240 mL (8 oz) every 10 minutes, until 4 L are consumed or the rectal effluent is clear; rapid drinking of each portion is preferred to drinking small amounts continuously. **Note:** The solution may be given via nasogastric tube to patients who are unwilling or unable to drink the solution.

MoviPrep®: Administer 2 L total with an additional 2 L of clear fluid prior to colonoscopy as follows:

Split dose: Evening before colonoscopy: 240 mL (8 oz) every 15 minutes until 1 L is consumed. Then drink 16 oz of clear liquid. On the morning of the colonoscopy, repeat process with second liter over 1 hour and then drink 16 oz of clear liquid at least 1 hour before the procedure.

Full dose: Evening before colonoscopy (~6 PM): 240 mL (8 oz every 15 minutes) until 1 L is consumed; 90 minutes later (~7:30 PM), repeat dose. Then drink 32 oz of clear liquid.

Nasogastric tube: 20-30 mL/minute (1.2-1.8 L/hour); the first bowel movement should occur ~1 hour after the start of administration.

Toxic ingestion (unlabeled use; AACT, 2004):*Nasogastric tube:* 1500-2000 mL/hour until rectal effluent is clear. **Note:** May take several hours for the rectal effluent to become clear. Duration may be extended if evidence of continued presence of toxins in GI tract (eg, radiographic evidence or ongoing elimination of toxins)

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Bowel cleansing prior to GI exam: (CoLyte®, GoLYTELY®, NuLYTELY®, TriLyte®):

Oral: 25 mL/kg/hour (some studies have used up to 40 mL/kg/hour) for 4-10 hours until rectal effluent is clear (maximum total dose: 4 L)

Nasogastric tube: 25 mL/kg/hour until rectal effluent is clear

Toxic ingestion (unlabeled use; AACT, 2004):*Nasogastric tube:*

Children ≥9 months to 6 years: 500 mL/hour until rectal effluent is clear

Children 6-12 years: 1000 mL/hour until rectal effluent is clear

Adolescents: 1500-2000 mL/hour until rectal effluent is clear

Note: May take several hours for the rectal effluent to become clear. Duration may be extended if evidence of continued presence of toxins in GI tract (eg, radiographic evidence or ongoing elimination of toxins)

Administration: OralRapid drinking of each portion is preferred to drinking small amounts continuously. Do not add flavorings, unless provided by the manufacturer, as additional ingredients before use. Chilled solution often more palatable. Oral medications should not be administered within 1 hour of start of therapy.
Dietary Considerations

CoLyte®, GoLYTELY®, NuLYTELY®, TriLyte®: Ideally, the patient should fast for ~3-4 hours prior to administration, but in no case should solid food be given for at least 2 hours before the solution is given. Some products contain aspartame which is metabolized to phenylalanine.

MoviPrep®: Patient should not eat solid food from start of solution administration until after colonoscopy. Patient may have clear liquid soup/plain yogurt for dinner; finish at least 1 hour before start of colon prep.

Storage

CoLyte®, GoLYTELY®, NuLYTELY®, TriLyte®: Store at controlled room temperature of 25°C (77°F) before reconstitution. Refrigerate reconstituted solution. Use within 48 hours of preparation.

MoviPrep®: Store at controlled room temperature of 25°C (77°F) before reconstitution. Refrigerate reconstituted solution. Use within 24 hours of preparation.

Reconstitution

CoLyte®, GoLYTELY®, NuLYTELY®, TriLyte®: Tap water may be used for preparation of the solution; shake container vigorously several times to ensure dissolution of powder.

MoviPrep®: Mix the contents of pouch A and pouch B (one each) in container provided. Add 1 L of lukewarm water; mix the solution until dissolved. Repeat mixing procedure if second liter is needed. Refrigerate reconstituted solution.

ContraindicationsHypersensitivity to polyethylene glycol or any component of the formulation; ileus, gastrointestinal obstruction, gastric retention, bowel perforation, toxic colitis, toxic megacolon

Warnings/Precautions

Concerns related to adverse effects:

- Seizures: Seizures associated with electrolyte abnormalities (eg, hyponatremia, hypokalemia) have occurred. Use with caution in patients with underlying hyponatremia or with concomitant administration of medications that alter electrolyte balance.

Disease-related concerns:

- Impaired gag reflux: Observe unconscious or semiconscious patients with impaired gag reflex or those who are otherwise prone to regurgitation or aspiration during administration.

- Ulcerative colitis: Use with caution in patients with severe ulcerative colitis.

Dosage form specific issues:

- MoviPrep®: May be safer to use in patients who cannot tolerate fluid load (eg, heart failure, renal insufficiency, ascites); not significantly absorbed. Use cautiously in patients with G6PD deficiency; contains ascorbic acid. Contains phenylalanine.

Other warnings/precautions:

- Appropriate use: Evaluate patients with symptoms of bowel obstruction (nausea, vomiting, abdominal pain or distension) prior to use. Do not add flavorings, unless provided by the manufacturer, as additional ingredients before use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted in animals or in humans.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsSignificant changes in the mother's fluid or electrolyte balance would not be expected.

Adverse Reactions

>10%:

Central nervous system: Malaise (18% to 27%)

Gastrointestinal: Abdominal distension (<60%), anal irritation (<52%), nausea (14% to 47%), abdominal pain (13% to 39%), vomiting (7% to 12%)

Neuromuscular & skeletal: Rigors (34%)

Miscellaneous: Thirst (<47%)

1% to 10%:

Central nervous system: Dizziness (7%), headache (2%)

Gastrointestinal: Dyspepsia (1% to 3%)

Frequency not defined, postmarketing, and/or case reports: Abdominal cramps, abdominal fullness, allergic reactions, anaphylaxis, aspiration, asystole, bloating, chest tightness, dehydration (children), dermatitis, dyspnea (acute), esophageal perforation, facial edema, flatulence, hypersensitivity reactions, hypokalemia (children), Mallory-Weiss tear, pulmonary edema, rash, rhinorrhea, seizure, throat tightness, upper GI bleeding, urticaria

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersElectrolytes, serum glucose, BUN, urine osmolality; children <2 years of age should be monitored for hypoglycemia, dehydration, hypokalemia

Nursing: Physical Assessment/MonitoringInstruct patient in appropriate use according to formulation and purpose for use.

Monitoring: Lab TestsElectrolytes, serum glucose, BUN, urine osmolality

Patient EducationFollow instructions exactly; directions will differ according to the formulation and the purpose for which this medication is taken. Do not eat any solid foods for at least 2 -3 hours before taking and do not take any other oral medication for 1 hour before taking. For bowel cleansing prior to GI exam, take 240 mL (8 oz) every 10 minutes, until 4 L is consumed or the rectal effluent is clear. Rapid drinking of each portion is preferred to drinking small amounts continuously. The first bowel movement should occur approximately 1 hour after the start of administration. May cause abdominal bloating and distention before bowel starts to move. If severe discomfort or distention occurs, stop drinking temporarily or drink each portion at longer intervals until these symptoms disappear. Continue drinking until the watery stool is clear and free of solid matter. This usually requires at least 3 L. It is best to drink all of the solutions. Discard any unused portion. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder, for oral solution: PEG 3350 240 g, sodium sulfate 22.72 g, sodium bicarbonate 6.72 g, sodium chloride 5.84 g, and potassium chloride 2.98 g (4000 mL)

Colyte®: PEG 3350 240 g, sodium sulfate 22.72 g, sodium bicarbonate 6.72 g, sodium chloride 5.84 g, and potassium chloride 2.98 g (4000 mL) [available with citrus berry, lemon lime, cherry, orange, and pineapple flavor packets]

GoLYTELY®:

PEG 3350 236 g, sodium sulfate 22.74 g, sodium bicarbonate 6.74 g, sodium chloride 5.86 g, and potassium chloride 2.97 g (4000 mL) [regular and pineapple flavor]

PEG 3350 227.1 g, sodium sulfate 21.5 g, sodium bicarbonate 6.36 g, sodium chloride 5.53 g, and potassium chloride 2.82 g per packet (1s) [regular flavor; makes 1 gallon of solution after mixing]

MoviPrep®: Pouch A: PEG 3350 100g, sodium sulfate 7.5 g, sodium chloride 2.69 g, potassium chloride 1.015 g; Pouch B: Ascorbic acid 4.7 g, sodium ascorbate 5.9 g (1000 mL) [contains phenylalanine 2.33 mg/treatment; lemon flavor; packaged with 2 of Pouch A and 2 of Pouch B in carton and a disposable reconstitution container]

NuLYTELY®: PEG 3350 420 g, sodium bicarbonate 5.72 g, sodium chloride 11.2 g, and potassium chloride 1.48 (4000 mL) [cherry, lemon-lime, orange, and pineapple flavors]

TriLyte®: PEG 3350 420 g, sodium bicarbonate 5.72 g, sodium chloride 11.2 g, and potassium chloride 1.48 g (4000 mL) [supplied with flavor packets]

Polymyxin B

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (intrathecal administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(pol i MIKS in bee)

U.S. Brand NamesPoly-Rx

Pharmacologic CategoryAntibiotic, Irrigation; Antibiotic, Miscellaneous

Use: Labeled IndicationsTreatment of acute infections caused by susceptible strains of *Pseudomonas aeruginosa*; used occasionally for gut decontamination; parenteral use of polymyxin B has mainly been replaced by less toxic antibiotics, reserved for life-threatening infections caused by organisms resistant to the preferred drugs (eg, pseudomonal meningitis - intrathecal administration)

Dosing: Adults

Ear canal infections (external): Otic (in combination with other drugs): Instill 1-2 drops, 3-4 times/day; should be used sparingly to avoid accumulation of excess debris.

Systemic infections:

I.M.: 25,000-30,000 units/kg/day divided every 4-6 hours

I.V.: 15,000-25,000 units/kg/day divided every 12 hours

Intrathecal: 50,000 units/day for 3-4 days, then every other day for at least 2 weeks

Note: Total daily dose should not exceed 2,000,000 units/day.

Bladder irrigation (in combination with 57 mg neomycin sulfate): Continuous irrigant or rinse in the urinary bladder for up to 10 days using 20 mg (equal to 200,000 units) added to 1 L of normal saline; usually no more than 1 L of irrigant is used per day unless urine flow rate is high; administration rate is adjusted to patient's urine output.

Topical irrigation or topical solution: 500,000 units/L of normal saline; topical irrigation should not exceed 2 million units/day in adults.

Ocular infections: Ophthalmic: A concentration of 0.1% to 0.25% is administered as 1-3 drops every hour, then increasing the interval as response indicates to 1-2 drops 4-6 times/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Ear canal infections (external): Otic (in combination with other drugs): 1-2 drops, 3-4 times/day; should be used sparingly to avoid accumulation of excess debris

Systemic infections: Infants <2 years:

I.M.: Up to 40,000 units/kg/day divided every 6 hours (not routinely recommended due to pain at injection sites)

I.V.: Up to 40,000 units/kg/day divided every 12 hours

Intrathecal: 20,000 units/day for 3-4 days, then 25,000 units every other day for at least 2 weeks after CSF cultures are negative and CSF (glucose) has returned to within normal limits

Children ≥2 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 20-50 mL/minute: Administer 75% to 100% of normal daily dose given in divided doses every 12 hours.

Cl_{cr} 5-20 mL/minute: Administer 50% of normal daily dose given in divided doses every 12 hours.

Cl_{cr} <5 mL/minute: Administer 15% of normal daily dose given in divided doses every 12 hours.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Administer into upper outer quadrant of gluteal muscle; however, I.M. route is not recommended due to severe pain at injection site.

Administration: I.V.Infuse over 60-90 minutes.

Administration: I.V. Detail**Extravasation management:** Monitor I.V. site closely; extravasation may cause serious injury with possible necrosis and tissue sloughing. Rotate infusion site frequently.

pH: 5.0-7.5

StoragePrior to reconstitution, store at room temperature of 15°C to 30°C (59°F to 86°F) and protect from light. After reconstitution, store under refrigeration at 2°C to 8°C (36°F to 46°F). Discard any unused solution after 72 hours.

Compatibility

Y-site administration: Compatible: Esmolol.

Compatibility in syringe: Compatible: Penicillin G sodium. **Variable (consult detailed reference):** Ampicillin.

Compatibility when admixed: Compatible: Amikacin, ascorbic acid injection, colistimethate, diphenhydramine, erythromycin lactobionate, hydrocortisone sodium succinate, kanamycin, lincomycin, penicillin G potassium, penicillin G sodium, phenobarbital, ranitidine, vitamin B complex with C. **Incompatible:** Amphotericin B, calcium chloride, calcium gluconate, cefazolin, chloramphenicol, chlorothiazide, heparin, magnesium sulfate.

ContraindicationsHypersensitivity to polymyxin B or any component of the formulation; concurrent use of neuromuscular blockers

Warnings/Precautions

Boxed warnings:

- I.M./I.T. administration: See “Other warnings/precautions” below.
- Nephrotoxicity: See “Concerns related to adverse effects” below.
- Neurotoxicity: See “Concerns related to adverse effects” below.
- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Nephrotoxicity: **[U.S. Boxed Warning]: May cause nephrotoxicity; avoid concurrent or sequential use of other nephrotoxic drugs (eg, aminoglycosides).** Usual risk factors include pre-existing renal impairment, advanced age and dehydration. Polymyxin B-induced nephrotoxicity may be manifested by albuminuria, cellular casts, and azotemia; discontinue therapy with decreasing urinary output and increasing BUN.
- Neurotoxicity: **[U.S. Boxed Warning]: May cause neurotoxicity, which can also result in respiratory paralysis from neuromuscular blockade especially when the drug is given soon after anesthesia or muscle relaxants. Avoid concurrent or sequential use of other neurotoxic drugs.** Neurotoxic reactions are usually associated with high serum levels, often in patients with renal dysfunction.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with impaired renal function; modify dosage.

Special populations:

- Pregnancy: **[U.S. Boxed Warning]: Safety in pregnant women not established.**

Other warnings/precautions:

- I.M./I.T. administration: **[U.S. Boxed Warning]: Intramuscular/intrathecal administration only to hospitalized patients.**
- Parenteral administration: Polymyxin B sulfate is most toxic when given parenterally; avoid parenteral use whenever possible.

Pregnancy Risk FactorB (per expert opinion)

Pregnancy Considerations**[U.S. Boxed Warning]: Safety in pregnant women has not been established.**

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Facial flushing

Central nervous system: Neurotoxicity (irritability, drowsiness, ataxia, perioral paresthesia, numbness of the extremities, and blurred vision); dizziness, drug fever, meningeal irritation with intrathecal administration

Dermatologic: Urticarial rash

Endocrine & metabolic: Hypocalcemia, hyponatremia, hypokalemia, hypochloremia

Local: Pain at injection site

Neuromuscular & skeletal: Neuromuscular blockade, weakness

Renal: Nephrotoxicity

Respiratory: Respiratory arrest

Miscellaneous: Anaphylactoid reaction

Drug Interactions

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Monitoring ParametersNeurologic symptoms and signs of superinfection; renal function (decreasing urine output and increasing BUN may require discontinuance of therapy)

Reference RangeSerum concentrations >5 mcg/mL are toxic in adults

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to starting therapy. Use caution with impaired renal function. Assess potential for interactions with other pharmacological agents patient may be taking (eg, nephrotoxic and neurotoxic drugs, neuromuscular blocking agents). See Adminstration for I.V. and I.M. specifics. Infusion site must be monitored closely to prevent extravasation; extravasation may cause serious injury with possible necrosis and tissue sloughing (rotate infusion site, should be rotated frequently). Assess therapeutic effectiveness (resolution of infection) and adverse reactions (eg, renal function, neurotoxicity [irritability, drowsiness, ataxia, perioral paresthesia, numbness of the extremities, and blurring of vision]; neuromuscular blockade, rash, respiratory paralysis, ototoxicity). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity prior to beginning therapy. Establish baseline renal function prior to initiating therapy. Monitor renal function closely.

Patient EducationWound irrigation/bladder irrigation/gut sterilization/I.V.: Immediately report numbness or tingling of mouth, tongue, or extremities; constant blurring of vision; increased nervousness or irritability; excessive drowsiness; or respiratory difficulty. For I.V. immediately report swelling, redness, burning, or pain at infusion site.

Ophthalmic: Tilt head back, place medication into eyes (as frequently as prescribed), close eyes, apply light pressure over inside corner of the eye for 1 minute. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). You may experience some stinging or burning or temporary blurring of vision; use caution driving or when engaging in hazardous tasks until vision clears. Report any adverse effects including respiratory difficulty or unusual numbness or tingling of mouth or tongue, increased nervousness or irritability, or excessive drowsiness.

Pregnancy/breast-feeding precautions: Consult prescriber if you suspect you might be pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 500,000 units

Powder [for prescription compounding]:

Poly-Rx: 100 million units (13 g)

Generic AvailableYes

Mechanism of ActionBinds to phospholipids, alters permeability, and damages the bacterial cytoplasmic membrane permitting leakage of intracellular constituents

Pharmacodynamics/Kinetics

Absorption: Well absorbed from peritoneum; minimal from GI tract (except in neonates) from mucous membranes or intact skin

Distribution: Minimal into CSF; does not cross placenta

Half-life elimination: 4.5-6 hours; prolonged with renal impairment

Time to peak, serum: I.M.: ~2 hours

Excretion: Urine (>60% primarily as unchanged drug)

Pharmacotherapy Pearls1 mg = 10,000 units

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause irritability, drowsiness, or ataxia

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsPolymyxin B Sulfate

International Brand NamesAerosporin (IN); Alosol (MX); Biodexan Ofteno (MX); Cortisporin Otico (MX); Dexsul (MX); Glubacida (MX); Isopto-Biotic (SE); Maxitrol (MX); Neobacigrin (MX); Neosporin (MX); Polixin (MX); Polymyxin B Pfizer (DE); Polymyxine B FNA (NL); Septilisin (MX); Synalar (MX); Syntex (MX); Tribiot (MX); Trioftín (MX)

Polysaccharide-Iron Complex

Medication Safety Issues

Sound-alike/look-alike issues:

Niferex® may be confused with Nephrox®

Pronunciation(pol i SAK a ride-EYE ern KOM pleks)
U.S. Brand NamesFerrex 150 [OTC]; Niferex® [OTC]; Nu-Iron® 150 [OTC]; Poly-Iron 150 [OTC]; ProFe [OTC]
Pharmacologic CategoryIron Salt
Use: Labeled IndicationsPrevention and treatment of iron-deficiency anemias
Dosing: Adults
Dietary Reference Intake: Dose is RDA presented as elemental iron unless otherwise noted:

19-50 years: Male: 8 mg/day; Female: 18 mg/day; Pregnant female: 27 mg/day; Lactating female: 9 mg/day

≥50 years: 8 mg/day

Iron deficiency (prevention/treatment): Oral:

Elixir: 50-100 mg twice daily

Capsules: 150-300 mg/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric
Dietary Reference Intake: Dose is RDA presented as elemental iron unless otherwise noted:

0-6 months: 0.27 mg/day (adequate intake)

7-12 months: 11 mg/day

1-3 years: 7 mg/day

4-8 years: 10 mg/day

9-13 years: 8 mg/day

14-18 years: Male: 11 mg/day; Female: 15 mg/day; Pregnant female: 27 mg/day; Lactating female: 10 mg/day

Iron deficiency (prevention/treatment): Oral: Children ≥6 years: Tablets/elixir: 50-100 mg/day; may be given in divided doses

Dietary ConsiderationsDietary sources of iron include beans, cereal (enriched), clams, beef, lentils, liver, oysters, shrimp, and turkey. Foods that enhance dietary absorption of iron include broccoli, grapefruit, orange juice, peppers and strawberries. Foods that decrease dietary absorption of iron include coffee, dairy products, soy products, spinach, and tea.
Allergy Considerations

- Iron Salt Allergy

Pregnancy ConsiderationsIt is recommended that pregnant women meet the dietary requirements of iron with diet and/or supplements in order to prevent adverse events associated with iron deficiency anemia in pregnancy. Treatment of iron deficiency anemia in pregnant women is the same as in nonpregnant women and in most cases, oral iron preparations may be used. Except in severe cases of maternal anemia, the fetus achieves normal iron stores regardless of maternal concentrations.
LactationEnters breast milk
Breast-Feeding ConsiderationsIron is normally found in breast milk. Breast milk or iron fortified formulas generally provide enough iron to meet the recommended dietary requirements of infants. The amount of iron in breast milk is generally not influenced by maternal iron status.
Adverse Reactions

>10%: Gastrointestinal: Stomach cramping, constipation, nausea, vomiting, dark stools, GI irritation, epigastric pain

1% to 10%:

Gastrointestinal: Diarrhea, heartburn

Genitourinary: Discolored urine

Miscellaneous: Staining of teeth

<1%: Contact irritation

Drug Interactions

Antacids: May decrease the absorption of Iron Salts. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Iron Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Cefdinir: Iron Salts may decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Dimercaprol: May enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

Eltrombopag: Iron Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., iron-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

H2-Antagonists: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Levodopa: Iron Salts may decrease the absorption of Levodopa. Only applies to oral iron preparations. *Risk D: Consider therapy modification*

Methyldopa: Iron Salts may decrease the absorption of Methyldopa. Only oral iron salts are of concern. *Risk D: Consider therapy modification*

Penicillamine: Iron Salts may decrease the absorption of Penicillamine. Only oral iron salts are a concern. *Risk D: Consider therapy modification*

Phosphate Supplements: Iron Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the absorption of Iron Salts. *Risk C: Monitor therapy*

Quinolone Antibiotics: Iron Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Iron Salts may decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: Elemental iron 150 mg

Ferrex 150, Nu-Iron® 150: Elemental iron 150 mg

Niferex®: Elemental iron 60 mg

Poly-Iron 150: Elemental iron 150 mg [contains tartrazine]

ProFe: Elemental iron 180 mg

Elixir:

Niferex®: Elemental iron 100 mg/5 mL (240 mL) [contains alcohol 10%; dye free, sugar free]

Generic AvailableYes: Capsule

Pricing: U.S. (www.drugstore.com)

Capsules (Ferrex 150)

150 mg (100): $19.99

Capsules (Niferex)

40-20 mg (100): $73.50

Capsules (Nu-Iron)

150 mg (100): $53.99

Capsules (Poly-Iron 150)

150 mg (90): $25.99

Elixir (Niferex)

100 mg/5 mL (236): $80.55

Pharmacotherapy Pearls100% elemental iron

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConstipation is common, concurrent use with psychotropic may produce additive effects

Index TermsIron-Polysaccharide Complex

Poractant Alfa

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(por AKT ant AL fa)

U.S. Brand NamesCurosurf®

Canadian Brand NamesCurosurf®

Pharmacologic CategoryLung Surfactant

Use: Labeled IndicationsTreatment of respiratory distress syndrome (RDS) in premature infants

Dosing: Pediatric**Premature infant with RDS:** Initial dose is 2.5 mL/kg of birth weight. Up to 2 subsequent doses of 1.25 mL/kg birth weight can be administered at 12-hour intervals if needed in infants who continue to require mechanical ventilation and supplemental oxygen. Maximum total dose: 5 mL/kg. **Note:** For intratracheal use **only**

Administration: OtherTake from refrigerator and warm to room temperature. Inspect for discoloration. The color should be white to creamy white. Gently turn the vial upside down to get a uniform suspension. Do not shake. Slowly withdraw the entire contents into a 3 mL or 5 mL plastic syringe through a large gauge needle (at least 20 gauge). Attach the catheter to the syringe. Fill the catheter with poractant alfa. Discard the excess through the catheter so that only the total dose to be given remains in the syringe.

Before administering, assure proper placement and patency of the endotracheal tube. The endotracheal tube may be suctioned before administering the poractant alpha. The drug is administered intratracheally through a 5-French end-hole catheter cut to a standard length of 8 cm **or** through a secondary lumen of a dual-lumen endotracheal tube (without interrupting mechanical ventilation). Up to 2 repeated doses may be administered, using the same technique at 12-hour intervals.

Administration using a 5-French end-hole catheter: The infant should be stable before proceeding with dosing. The infant's ventilator settings should be changed to a rate of 40-60 breaths/minute, inspiratory time 0.5 seconds, and supplemental oxygen to maintain SaO_2 >92%. Keep the head and body of the infant in alignment without inclination. Briefly disconnect the endotracheal tube from the ventilator, insert the 5-French catheter. This catheter is inserted into the infant's endotracheal tube with the tip positioned distally in the endotracheal tube. The catheter tip should not extend beyond the distal tip of the endotracheal tube. Each dose should be administered in two aliquots with each aliquot administered into one of the two main bronchi by positioning the infant with either the right or left side dependent.

Insert the first aliquot (1.25 mL/kg birth weight) and position the infant so that either the right or left side is dependent for the aliquot. Remove the catheter and manually ventilate the infant with 100% oxygen at a rate of 40-60 breaths/minute for 1 minute. When the infant is stable, reposition the infant such that the other side is dependent and administer the remaining aliquot using the same technique. Remove the catheter without flushing. Do not suction the airways for 1 hour after instillation unless signs of significant airway obstruction occur. Resume ventilator management and clinical care.

Administration using the secondary lumen of a dual-lumen endotracheal tube: Slowly withdraw the entire vial content into a 3 mL or 5 mL plastic syringe through a large gauge needle (at least 20 gauge). Keep infant in neutral position and administer poractant through the proximal end of the secondary lumen of the endotracheal tube as a single dose over 1 minute (without interrupting mechanical ventilation); transient increases in F_1O_2, ventilatory rate, or peak inspiratory pressure (PIP) may be required.

pH: 6.2 (5.5-6.5; adjusted as required with sodium bicarbonate)

StorageStore under refrigeration at defined temperature of 2°C to 8°C (36°F to 46°F). Unopened, unused vials that have been warmed to room temperature can be returned to refrigerator storage within 24 hours for future use. Do not warm and then refrigerate more than once. Vials are for single use only. Protect from light. Do not shake.

ContraindicationsNo known contraindications

Warnings/Precautions

Concerns related to adverse effects:

- Pulmonary hemorrhage: Pulmonary hemorrhage is a known complication of premature birth and very low birth-weight. It has been reported in both clinical trials and postmarketing reports in infants who have received poractant.
- Transient adverse effects: Transient episodes of bradycardia, decreased oxygen saturation, hypotension, or endotracheal tube blockage may occur. Discontinue dosing procedure and initiate measures to alleviate the condition; may reinstitute after the patient is stable.

Other warnings/precautions:

- Administration: For intratracheal administration only.
- Appropriate use: Correct acidosis, hypotension, anemia, hypoglycemia, and hypothermia before use.
- Monitoring: Produces rapid improvements in lung oxygenation and compliance; may require frequent adjustments to oxygen delivery and ventilator settings.
- Trained personnel: Rapidly affects oxygenation and lung compliance; restrict use to a highly-supervised clinical setting with immediate availability of clinicians experienced in intubation and ventilatory management of premature infants.

Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, hypotension

Respiratory: Endotracheal tube blockage, oxygen desaturation

Postmarketing and/or case reports: Pulmonary hemorrhage

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersArterial blood gases, ventilator measurement assessment
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, intratracheal [preservative free; porcine derived]:

Curosurf®: 80 mg/mL (1.5 mL, 3 mL)

Generic AvailableNo
ManufacturerDey
Mechanism of ActionEndogenous pulmonary surfactant reduces surface tension at the air-liquid interface of the alveoli during ventilation and stabilizes the alveoli against collapse at resting transpulmonary pressures. A deficiency of pulmonary surfactant in preterm infants results in respiratory distress syndrome characterized by poor lung expansion, inadequate gas exchange, and atelectasis. Poractant alpha compensates for the surfactant deficiency and restores surface activity to the infant's lungs. It reduces mortality and pneumothoraces associated with RDS.
Pharmacodynamics/KineticsInformation limited to animal models. No human pharmacokinetic information is available.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(POR fi mer)
U.S. Brand NamesPhotofrin®
Canadian Brand NamesPhotofrin®
Pharmacologic CategoryAntineoplastic Agent, Miscellaneous
Use: Labeled IndicationsPalliation in patients with obstructing (partial or complete) esophageal cancer; treatment of microinvasive endobronchial nonsmall cell lung cancer (NSCLC); reduction of obstruction and palliation in patients with obstructing (partial or complete) NSCLC; ablation of high-grade dysplasia in Barrett's esophagus
Use: Unlabeled/InvestigationalTreatment of gastric cancer (obstruction); treatment of actinic keratoses and low-risk basal and squamous cell skin cancers
Dosing: Adults**Cancer photodynamic therapy:** I.V.: 2 mg/kg, followed by exposure to the appropriate laser light; repeat courses must be separated by at least 30 days (esophageal or endobronchial cancer) or 90 days (Barrett’s esophagus; delay subsequent treatment for insufficient healing) for a maximum of 3 courses
Dosing: ElderlyRefer to adult dosing.
Administration: I.V.Administer slow I.V. injection over 3-5 minutes. Avoid contact with skin during administration.
Administration: I.V. DetailAvoid extravasation.

pH: 7-8

StorageStore intact vials at controlled room temperature of 20°C to 25°C (68°F to 77°F). Reconstituted solutions should be protected from light and used immediately after preparation.
ReconstitutionReconstitute each vial of porfimer with 31.8 mL of either D_5W or NS injection resulting in a final concentration of 2.5 mg/mL. Shake well until dissolved. Protect the reconstituted product from bright light and use immediately. Use appropriate precautions for handling and disposal.
CompatibilityDo not mix porfimer with other drugs in the same solution.
ContraindicationsPorphyria

Photodynamic therapy (PDT) is contraindicated in patients with tracheoesophageal or bronchoesophageal fistula; tumors eroding into a major blood vessel; severe acute respiratory distress when caused by endobronchial lesion; esophageal or gastric varices; esophageal ulcers >1 cm in diameter

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Chest pain: Inflammatory responses within the treatment area may result in substernal chest pain.
- Ocular photosensitivity: Ocular discomfort has been reported; for at least 30 days, when outdoors, patients should wear dark sunglasses which have an average white light transmittance of <4%. Patients should be educated to test for residual photosensitivity before resuming exposure to sunlight.
- Photosensitivity: In patients who are exposed to direct sunlight or bright indoor light (eg fluorescent lights, unshaded light bulbs, examination/operating lights), photosensitivity reactions are common. Conventional ultraviolet (UV) sunscreens are **not** protective against photosensitivity reactions caused by visible light. Photosensitivity may last 30-90 days. Encourage exposure to ambient indoor light (aids in gradually inactivating residual porfimer).

Disease-related concerns:

- Barrett's esophagus: In patients with Barrett's esophagus, conduct rigorous surveillance (endoscopic biopsy every 3 months until 4 consecutive negative results for high-grade dysplasia followed by further follow-up per physician judgement). Esophageal strictures are common adverse events associated with photodynamic therapy of Barrett's esophagus; esophageal dilation may be required.
- Endobronchial tumors: When treating endobronchial tumors, use caution if treatment-induced inflammation may obstruct airway. Assess patient for possibility of tumor erosion into a pulmonary blood vessel (contraindication); fatal massive pulmonary hemoptysis (FMH) may occur. Risk factors for FMH include large, centrally-located tumors, cavitating tumors, or extensive tumor extrinsic to the bronchus. Fistula formation may occur after resolution of tumors with deep bronchial wall invasion.
- Esophageal/gastric varices: Generally not suited for treatment of patients with esophageal or gastric varices; if used in esophageal

varices, extreme caution is warranted and light exposure to the varices should be avoided.

- Esophageal tumors: Porfimer treatment for tumors which erode into the trachea or bronchial tree are likely to cause fistula; use in not recommended. Use is contraindicated in patients with existing tracheoesophageal or bronchoesophageal fistula.

- Hepatic impairment: Elimination may be prolonged in hepatic impairment; toxicities may be increased. Photosensitivity may be increased beyond 90 days in patients with mild-to-severe hepatic impairment.

- Renal impairment: Elimination may be prolonged in renal impairment; toxicities may be increased. Photosensitivity may be increased beyond 90 days in patients with severe renal impairment.

Concurrent drug therapy issues:

- Photosensitizing drugs: Concurrent use with other photosensitizing agents may increase the risk for photosensitivity reactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Radiation therapy recipients: Allow 2-4 weeks to elapse after phototherapy prior to initiating radiation therapy; 4 weeks should elapse after radiation therapy prior to initiating phototherapy.

Other warnings/precautions:

- Extravasation: Avoid extravasation. If extravasation occurs, protect affected area from light.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have shown maternal and fetal toxicity, but no major malformations. Effective contraception is recommended for women of childbearing potential.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Cardiovascular: Chest pain (7% to 31%; substernal: 5%), edema (5% to 18%)

Central nervous system: Fever (8% to 31%), pain (1% to 22%), insomnia (5% to 14%)

Dermatologic: Photosensitivity reaction (19% to 22% in cancer patients; 37% to 69% in Barrett’s esophagus patients; severe: 10%)

Gastrointestinal: Esophageal stricture/stenosis (6% in esophageal cancer patients; 30% to 36% in Barrett's esophagus patients), nausea (24% to 37%), vomiting (17% to 31%), constipation (5% to 24%), dysphagia (10% to 24%), mucositis (20% in superficial endobronchial cancer), abdominal pain (5% to 20%)

Hematologic: Anemia (32% in esophageal cancer patients)

Neuromuscular & skeletal: Back pain (3% to 11%)

Respiratory: Pleural effusion (32% in esophageal cancer patients; 12% in Barrett's esophagus patients; ≤5% in endobronchial cancer patients), dyspnea (7% to 30%), bronchial obstruction/mucus plug (21%), pneumonia (6% to 18%), hemoptysis (7% to 16%), cough (5% to 15%), bronchostenosis (11%), pharyngitis (11%)

5% to 10%:

Cardiovascular: Atrial fibrillation (10%), hypotension (7%), cardiac failure (7% in esophageal cancer), hypertension (6%), tachycardia (6%)

Central nervous system: Anxiety (3% to 7%), dysphonia (3% to 5%)

Endocrine & metabolic: Dehydration (7% to 10%)

Gastrointestinal: Weight loss (5% to 9%), anorexia (8%), esophageal edema (8%), hematemesis (8%), esophageal pain (7%), dyspepsia (1% to 6%), diarrhea (5%), eructation (5%), esophagitis (5%), melena (5%), odynophagia (5%)

Genitourinary: Urinary tract infection (7%)

Respiratory: Respiratory insufficiency (≤10%), bronchitis (10%), bronchial ulceration (9%), tracheoesophageal fistula (6%), fatal massive hemoptysis (≤5%)

Miscellaneous: Moniliasis (9%), tumor hemorrhage (8%), hiccups (5%), surgical complication (5% in esophageal cancer patients)

<5%, postmarketing, and/or case reports (limited to important or life-threatening): Abnormal vision, angina, bradycardia, bronchospasm, cataracts, diplopia, erythema, esophageal perforation, eye pain, fluid imbalance, gastric ulcer, hair growth increased, ileus, jaundice, laryngotracheal edema, lung abscess, MI, ocular sensitivity, peritonitis, photophobia, pneumonitis, pruritus, pseudoporphyria state, pulmonary edema, pulmonary embolism, pulmonary hemorrhage, pulmonary thrombosis, respiratory failure, sepsis, sick sinus syndrome, skin blistering, skin discoloration, skin fragility, skin nodules, skin wrinkles, stridor, supraventricular tachycardia

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringEvaluate for renal or hepatic impairment prior to beginning therapy. Assess other pharmacological agents or herbal products patient may be taking that may increase photosensitivity reaction. Infusion site must be monitored closely to prevent extravasation; if extravasation occurs, site should be protected from light. Patients will be photosensitive and must be protected from direct sunlight or bright indoor light for 30–60 days after treatment. However, ambient indoor light is beneficial (should not stay in dark rooms). Assess patient response (eg, atrial fibrillation, hyper-/hypotension, hyperthermia, GI pain or upset, anemia, dyspnea, respiratory insufficiency, dehydration). Teach patient (caregiver) possible side effects/appropriate interventions (light exposure) and adverse symptoms to report.

Patient EducationThis drug can only be given by injection or infusion. Report immediately any redness, swelling, burning, or pain at infusion site. The infusion will be followed by laser light therapy. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be highly sensitive to bright light. Avoid exposure to sunlight or bright indoor light for at least 30 days following treatment (cover skin with protective clothing and wear dark sunglasses with light transmittance <4% when outdoors - severe blistering, burning, and skin/eye damage can result). Conventional sunscreens do not protect against photosensitization. After 30 days, test small area of skin (not face) for remaining sensitivity. Retest sensitivity if traveling to a different geographic area with greater sunshine. Exposure to indoor normal light is beneficial since it will help dissipate photosensitivity gradually. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Report rapid heart rate, chest pain or palpitations, respiratory difficulty or air hunger, persistent fever or chills, foul-smelling urine or burning on urination, swelling of extremities, increased anxiety, confusion, or hallucination. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium:

Photofrin®: 75 mg

Generic AvailableNo

ManufacturerAxcan Pharma Inc

Mechanism of ActionPorfimer's cytotoxic activity is dependent on light and oxygen. Following administration, the drug is selectively retained in neoplastic tissues. Exposure of the drug to laser light at wavelengths >630 nm results in the production of oxygen free-radicals. Release of thromboxane A_2, leading to vascular occlusion and ischemic necrosis, may also occur.

Pharmacodynamics/Kinetics

Distribution: V_{dss}: 0.49 L/kg

Protein binding, plasma: ~90%

Half-life elimination: Mean: 17 days (range: 13-21 days)

Time to peak, serum: Adults: Females: ~90 minutes; Males: ~10 minutes

Excretion: Feces; Clearance: Plasma: Total: 0.051 mL/minute/kg

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia is common; may cause anxiety or confusion

Mental Health: Effects on Psychiatric TreatmentMay cause anemia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may increase the risk of photosensitivity reactions

U.S. Brand NamesNoxafil®

Canadian Brand NamesPosanol™

Pharmacologic CategoryAntifungal Agent, Oral

Use: Labeled IndicationsProphylaxis of invasive *Aspergillus* and *Candida* infections in severely-immunocompromised patients [eg, hematopoietic stem cell transplant (HSCT) recipients with graft-versus-host disease (GVHD) or those with prolonged neutropenia secondary to chemotherapy for hematologic malignancies]; treatment of oropharyngeal candidiasis (including patients refractory to itraconazole and/or fluconazole)

Use: Unlabeled/InvestigationalSalvage therapy of refractory invasive fungal infections; mucormycosis

Use: DentalTreatment of oropharyngeal candidiasis (including patients refractory to itraconazole and/or fluconazole)

Dosing: Adults

Aspergillosis, invasive: Oral:

Prophylaxis: 200 mg 3 times/day

Treatment of refractory infection (unlabeled use): 200 mg 4 times/day initially; after disease stabilization may decrease frequency to 400 mg twice daily in divided doses. **Note:** Duration of therapy should be a minimum of 6-12 weeks or throughout period of immunosuppression.

Candidal infections: Oral:

Prophylaxis: 200 mg 3 times/day

Treatment of oropharyngeal infection: Initial: 100 mg twice daily for 1 day; maintenance: 100 mg once daily for 13 days

Treatment of refractory oropharyngeal infection: 400 mg twice daily

Mucormycosis (unlabeled use): 800 mg/day in 2 or 4 divided doses

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Aspergillosis, invasive: Oral: Children ≥13 years: Refer to adult dosing.

Candidal infections: Oral: Children ≥13 years: Refer to adult dosing.

Mucormycosis (unlabeled use): Oral: Children ≥13 years: Refer to adult dosing.

Dosing: Renal ImpairmentNo adjustment necessary; use caution in severe renal impairment and monitor for breakthrough fungal infections. Variability in posaconazole exposure observed with Cl_{cr}<20 mL/minute.

Dosing: Hepatic ImpairmentNo adjustment necessary; use with caution.

Administration: OralShake well before use. Must be administered with a full meal or an oral liquid nutritional supplement. Administer oral suspension using dosing spoon provided by the manufacturer; spoon should be rinsed clean with water after each use and before storage.

Dietary ConsiderationsGive with meals. If alternative antifungal therapy can not be given to patients without food intake or severe diarrhea/vomiting, close monitoring for breakthrough fungal infections must be performed. Adequate posaconazole absorption from GI tract and subsequent plasma concentrations are dependent on food for efficacy. Lower average plasma concentrations have been associated with an increased risk of treatment failure.

StorageStore at controlled room temperature of 25°C (77°F); do not freeze.

ContraindicationsHypersensitivity to posaconazole or any component of the formulation; coadministration of cisapride, ergot alkaloids, pimozide, quinidine, or sirolimus

Warnings/Precautions

Concerns related to adverse effects:

- Azole hypersensitivity: Use with caution in patients with hypersensitivity to other azole antifungal agents; cross-reaction may occur, but has not been established.

- Hepatic effects: Hepatic dysfunction has occurred, ranging from mild/moderate increases of ALT/AST, alkaline phosphatase, and/or clinical hepatitis to severe reactions (cholestasis, hepatic failure including death); use with caution in patients with hepatic impairment.

Disease-related concerns:

- Arrhythmias: Use caution in patients with an increased risk of arrhythmia (concurrent QT_c-prolonging drugs, hypokalemia). Correct electrolyte abnormalities (eg, potassium, magnesium, and calcium) before initiating therapy.

- GI disturbances: Monitor closely for breakthrough fungal infections in patients with severe diarrhea or vomiting.

- Renal impairment: Use caution in patients with severe renal impairment due to variability in exposure; monitor for breakthrough fungal infections.

Concurrent drug therapy issues:

- Cyclosporine: Concurrent use may significantly increase cyclosporine levels and may result in rare serious adverse events (eg, nephrotoxicity, leukoencephalopathy, and death); dose reduction and close monitoring are recommended with initiation of posaconazole therapy.

- High potential for interactions: Consider alternative therapy or closely monitor for breakthrough fungal infections in patients receiving drugs that decrease absorption or increase the metabolism of posaconazole.

Special populations:

- Patients unable to take or tolerate nutritional supplements: Consider alternative antifungal therapy or closely monitor for breakthrough fungal infections in any patient unable to eat or tolerate an oral liquid nutritional supplement.

- Pediatrics: Safety and efficacy have not been established in children <13 years of age.

Geriatric ConsiderationsDosage adjustment not necessary.
Pregnancy Risk FactorC
Pregnancy ConsiderationsPosaconazole has been shown to be teratogenic in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if the benefit to the mother justifies potential risk to the fetus.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsExcretion in breast milk has not been investigated; use only if the benefit to the mother justifies potential risk to the fetus.
Adverse Reactions**Note:** A higher frequency of adverse reactions was observed in studies with refractory oropharyngeal candidiasis patients and percentages are included below.

>10%: Gastrointestinal: Diarrhea (3% to 11%)

1% to 10%:

Cardiovascular: QT_c prolongation (4%), hypertension (1%)

Central nervous system: Headache (1% to 8%), dizziness (1% to 3%), fatigue (1% to 3%), insomnia (1% to 3%), fever (up to 3%), somnolence (1%)

Dermatologic: Rash (1% to 4%), pruritus (1% to 2%)

Endocrine & metabolic: Hypokalemia (3%)

Gastrointestinal: Nausea (5% to 8%), vomiting (4% to 7%), abdominal pain (1% to 5%), flatulence (1% to 5%), anorexia (1% to 3%), mucositis (2%), dyspepsia (1% to 2%), xerostomia (1% to 2%), taste perversion (1%), constipation (up to 1%)

Hematologic: Neutropenia (2% to 8%), anemia (up to 3%), thrombocytopenia (up to 2%)

Hepatic: Bilirubin increased (2% to 3%), ALT increased (2% to 3%), AST increased (2% to 3%), GGT increased (2% to 3%), alkaline phosphatase increased (1% to 2%), hepatocellular damage (1%)

Neuromuscular & skeletal: Weakness (1% to 3%), myalgia (up to 2%), tremor (1%)

Ocular: Blurred vision (1%)

Renal: Serum creatinine increased (2%)

<1%, postmarketing, and/or case reports: Adrenal insufficiency, allergic/hypersensitivity reactions, cholestasis, hemolytic uremic syndrome, hepatic failure, hepatitis, pulmonary embolus, thrombotic thrombocytopenic purpura, torsade de pointes

Metabolism/Transport Effects**Inhibits** CYP3A4 (strong)
Drug Interactions

Alfentanil: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amphotericin B: Antifungal Agents (Azole Derivatives, Systemic) may diminish the therapeutic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Aprepitant: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Aprepitant. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Quazepam. *Risk D: Consider therapy modification*

Bosentan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Bosentan. *Risk C: Monitor therapy*

BusPIRone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Busulfan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Busulfan. *Risk C: Monitor therapy*

Calcium Channel Blockers: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Cardiac Glycosides: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Cinacalcet: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cinacalcet. *Risk C: Monitor therapy*

Cisapride: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Conivaptan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Conivaptan. *Risk X: Avoid combination*

Corticosteroids (Orally Inhaled): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Didanosine: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). Enteric coated didanosine capsules are not expected to affect these antifungals. *Risk D: Consider therapy modification*

Docetaxel: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Docetaxel. *Risk D: Consider therapy modification*

Dofetilide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Dofetilide. *Risk X: Avoid combination*

Efavirenz: May decrease the serum concentration of Posaconazole. *Risk X: Avoid combination*

Eletriptan: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eplerenone. *Risk D: Consider therapy modification*

Ergot Derivatives: Posaconazole may increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Erlotinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Erlotinib. *Risk C: Monitor therapy*

Eszopiclone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eszopiclone. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fosaprepitant: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Fosaprepitant. Specifically, concentrations of aprepitant are likely to be increased. *Risk C: Monitor therapy*

Gefitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Gefitinib. *Risk C: Monitor therapy*

Grapefruit Juice: May increase the metabolism of Antifungal Agents (Azole Derivatives, Systemic). This specifically applies to oral antifungal administration. *Risk D: Consider therapy modification*

H2-Antagonists: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Imatinib. *Risk C: Monitor therapy*

Irinotecan: Antifungal Agents (Azole Derivatives, Systemic) may enhance the adverse/toxic effect of Irinotecan. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Losartan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Methadone. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Phenytoin: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Phenytoin. Phenytoin may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. *Risk D: Consider therapy modification*

QuiNIDine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of QuiNIDine. Management: Itraconazole, voriconazole, and posaconazole are specifically contraindicated with quinidine. Use of quinidine with any azole antifungal may require quinidine dose adjustment and should be done with caution and close monitoring. *Risk X: Avoid combination*

Ramelteon: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Rifamycin Derivatives: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Sirolimus. Management: Sirolimus dose reductions of up to 50-90% may be necessary when starting an azole antifungal. Use of sirolimus with the azole antifungals voriconazole and posaconazole is contraindicated. *Risk D: Consider therapy modification*

Solifenacin: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Solifenacin. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Sucralfate: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk C: Monitor therapy*

Sunitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are likely to be increased more substantially than those of the parent temsirolimus. *Risk D: Consider therapy modification*

Tolterodine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk D: Consider therapy modification*

VinCRIStine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of VinCRIStine. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Posaconazole may increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Zolpidem: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Zolpidem. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Bioavailability increased ~3-4 times when posaconazole administered with a meal or an oral liquid nutritional supplement. Grapefruit juice may decrease the levels/effects of posaconazole; concurrent use should be avoided.

Monitoring ParametersHepatic function (eg, AST/ALT, alkaline phosphatase and bilirubin) prior to initiation and during treatment; renal function; electrolyte disturbances (eg, calcium, magnesium, potassium); CBC

Nursing: Physical Assessment/MonitoringAssess hepatic and renal function, allergy history, and ability to eat or tolerate an oral liquid nutritional supplement prior to beginning therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests, therapeutic effectiveness (resolution of fungal infection), and adverse response (eg, gastrointestinal disturbance, vision changes, hepatic toxicity [increased liver enzymes, jaundice], CNS changes) on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsHepatic function (eg, AST/ALT, alkaline phosphatase and bilirubin) prior to initiation and during treatment; renal function; electrolyte disturbances (eg, calcium, magnesium, potassium); CBC

Patient EducationDo not take any new prescription or OTC medications, or herbal products during therapy without consulting prescriber. Take exactly as directed. Take full course of medication as ordered; do not discontinue without consulting prescriber (fungal infections may take weeks or months of therapy). Must be taken with full meal or liquid nutritional supplement. Maintain adequate hydration (2-3 L/day of fluids, unless instructed to restrict fluid intake). You may experience diarrhea (buttermilk, boiled milk, or yogurt may help); nausea, vomiting, abdominal pain, or loss of appetite (frequent oral care, sucking lozenges, or chewing gum may help); or constipation (increased dietary fiber, liquids, or exercise may help); headache, dizziness, blurred vision, or insomnia (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report immediately chest pain or palpitations; unusual muscle pain or weakness; unresolved or persistent gastrointestinal upset; urinary pattern changes; yellowing of skin or eyes; changes in color of stool or urine; or any other persistent side effects. **Pregnancy/breast-feeding precautions:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral:

Noxafil®: 40 mg/mL (123 mL) [contains sodium benzoate; delivers 105 mL of suspension; cherry flavor; packaged with calibrated dosing spoon]

Generic AvailableNo

ManufacturerSchering-Plough

Mechanism of ActionInterferes with fungal cytochrome P450 (latosterol-14α-demethylase) activity, decreasing ergosterol synthesis (principal sterol in fungal cell membrane) and inhibiting fungal cell membrane formation.

Pharmacodynamics/Kinetics

Absorption: Food and/or liquid nutritional supplements increase absorption; fasting states do not provide sufficient absorption to ensure adequate plasma concentrations

Distribution: V_d: 465-1774 L

Protein binding: ≥97%; predominantly bound to albumin

Metabolism: Not significantly metabolized; ~15% to 17% undergoes non-CYP-mediated metabolism, primarily via hepatic glucuronidation into metabolites

Half-life elimination: 35 hours (range: 20-66 hours)

Time to peak, plasma: ~3-5 hours

Excretion: Feces 71% to 77% (~66% as unchanged drug); urine 13% to 14% (<0.2% as unchanged drug)

Dental Health Professional ConsiderationsThis drug is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Posaconazole is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), abnormal taste, mucositis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, fatigue, or insomnia

Mental Health: Effects on Psychiatric TreatmentContraindicated with pimozide and ergot alkaloids. Diarrhea and other GI side effects are common and may be worse with combined use of lithium, valproic acid, carbamazepine, or SSRIs. May cause neutropenia; use caution with clozapine. May cause thrombocytopenia; use caution with valproic acid. May increase level of some benzodiazepines, mirtazapine, nefazodone, or venlafaxine; monitor for increased effects and/or toxicity.

Medication Safety Issues

Consider special storage requirements for intravenous potassium salts; I.V. potassium salts have been administered IVP in error, leading to fatal outcomes.

Pronunciation(poe TASS ee um AS e tate)
Pharmacologic CategoryElectrolyte Supplement, Parenteral
Use: Labeled IndicationsPotassium deficiency; to avoid chloride when high concentration of potassium is needed, source of bicarbonate
Dosing: AdultsI.V. doses should be incorporated into the patient's maintenance I.V. fluids, intermittent I.V. potassium administration should be reserved for severe depletion situations and requires ECG monitoring; doses listed as mEq of potassium

Treatment of hypokalemia: I.V.: 40-100 mEq/day

I.V. intermittent infusion (must be diluted prior to administration):

5-10 mEq/dose (maximum: 40 mEq/dose) to infuse over 2-3 hours (maximum: 40 mEq over 1 hour)

Note: Continuous cardiac monitor recommended for rates >0.5 mEq/hour

Potassium dosage/rate of infusion guidelines:

Serum potassium >2.5 mEq/L: Maximum infusion rate: 10 mEq/hour; maximum concentration: 40 mEq/L; maximum 24-hour dose: 200 mEq

Serum potassium <2.5 mEq/L: Maximum infusion rate: 40 mEq/hour; maximum concentration: 80 mEq/L; maximum 24-hour dose: 400 mEq

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricI.V. doses should be incorporated into the patient's maintenance I.V. fluids, intermittent I.V. potassium administration should be reserved for severe depletion situations and requires ECG monitoring; doses listed as mEq of potassium.

Note: Use caution in premature neonates; potassium acetate for injection contains aluminum.

Treatment of hypokalemia: I.V.: 2-5 mEq/kg/day

I.V. intermittent infusion (must be diluted prior to administration): 0.5-1 mEq/kg/dose (maximum: 30 mEq/dose) to infuse at 0.3-0.5 mEq/kg/hour (maximum: 1 mEq/kg/hour)

Note: Continuous cardiac monitor recommended for rates >0.5 mEq/hour

Potassium dosage/rate of infusion guidelines:

Serum potassium >2.5 mEq/L: Maximum infusion rate: 10 mEq/hour; maximum concentration: 40 mEq/L; maximum 24-hour dose: 200 mEq

Serum potassium <2.5 mEq/L: Maximum infusion rate: 40 mEq/hour; maximum concentration: 80 mEq/L; maximum 24-hour dose: 400 mEq

Dosing: Renal ImpairmentUse caution; potassium acetate injection contains aluminum.
Administration: I.V. DetailPotassium must be diluted prior to parenteral administration; maximum recommended concentration (peripheral line): 80 mEq/L; maximum recommended concentration (central line): 150 mEq/L or 15 mEq/100 mL; in severely fluid-restricted patients (with central lines): 200 mEq/L or 20 mEq/100 mL has been used; maximum rate of infusion, see Dosage, I.V. intermittent infusion
Compatibility

Y-site administration: Compatible: Ciprofloxacin.

Compatibility when admixed: Compatible: Metoclopramide.

ContraindicationsSevere renal impairment; hyperkalemia
Warnings/Precautions

Concerns related to adverse effects:

- Hyperkalemia: Close monitoring of serum potassium concentrations is needed to avoid hyperkalemia; severe hyperkalemia may lead to muscle weakness/paralysis and cardiac conduction abnormalities (eg, heart block, ventricular arrhythmias, asystole).

Disease-related concerns:

- Acid/base disorders: Use with caution in patients with acid/base alterations; changes in serum potassium concentrations can occur during acid/base correction, monitor closely.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (eg, heart failure, cardiac arrhythmias); patients may be more susceptible to life-threatening cardiac effects associated with hyper/hypokalemia.

- Potassium-altering conditions/disorders: Use with caution in patients with disorders or conditions likely to contribute to altered serum potassium and hyperkalemia (eg, untreated Addison's disease, heat cramps, severe tissue breakdown from trauma or burns).

- Renal impairment: Use with caution in patients with renal impairment; monitor serum potassium concentrations closely. Contraindicated with severe impairment.

Concurrent drug therapy issues:

- Digitalis: Use with caution in digitalized patients; may be more susceptible to potentially life-threatening cardiac effects with rapid changes in serum potassium concentrations.

- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEIs, potassium-sparing diuretics, potassium containing salt substitutes).

Dosage form specific issues:

- Aluminum: Solution for injection contains aluminum; use with caution in patients with impaired renal function and in premature infants.

Other warnings/precautions:

- Parenteral administration: Use extreme caution with parenteral administration and monitor serum potassium concentrations closely. Evaluate renal function, cardiac and fluid status, and any factors contributing to altered potassium concentrations (eg, acidosis, alkalosis) prior to therapy. Do **NOT** administer undiluted or I.V. push; inappropriate parenteral administration may be fatal. Always administer potassium further diluted; refer to appropriate dilution and administration rate recommendations. Pain and phlebitis may occur during parenteral infusion requiring a decrease in infusion rate or potassium concentration.

Pregnancy Risk FactorC

Adverse Reactions

1% to 10%:

Cardiovascular: Bradycardia

Endocrine & metabolic: Hyperkalemia

Neuromuscular & skeletal: Weakness

Respiratory: Dyspnea

Local: Local tissue necrosis with extravasation

<1%: Abdominal pain, alkalosis, chest pain, mental confusion, paralysis, paresthesia, phlebitis, throat pain

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Monitoring: Lab TestsSerum potassium

Patient EducationThis form of potassium may only be given I.V. Report immediately any burning or pain at infusion site, chest pain, palpitations, unusual weakness in muscles, tarry stools, or easy bruising.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 2 mEq/mL (20 mL, 50 mL, 100 mL) [contains aluminum]

Injection, solution [concentrate]: 4 mEq/mL (50 mL) [contains aluminum]

Generic AvailableYes

Mechanism of ActionPotassium is the major cation of intracellular fluid and is essential for the conduction of nerve impulses in heart, brain, and skeletal muscle; contraction of cardiac, skeletal and smooth muscles; maintenance of normal renal function, acid-base balance, carbohydrate metabolism, and gastric secretion

Pharmacodynamics/Kinetics

Distribution: Enters cells via active transport from extracellular fluid

Excretion: Primarily urine; skin and feces (small amounts); most intestinal potassium reabsorbed

Pharmacotherapy Pearls1 mEq of acetate is equivalent to the alkalinizing effect of 1 mEq of bicarbonate.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Mental Health CommentHypokalemia is associated with an increased risk of ventricular dysrhythmias; use antipsychotics with caution (especially ziprasidone).

Cardiovascular ConsiderationsHypokalemia is highly arrhythmogenic, particularly in the setting of ischemia or digitalis toxicity. ECG evidence of hypokalemia includes flattening of the T wave. As the T wave shrinks, U waves may appear. There is no prolongation of the QT interval. Hyperkalemia may present as tall peaked symmetrical T waves. S-T elevation may present in severe hyperkalemia. QRS complex progressively widens with eventual apparent sine waves on the ECG. Hyperkalemia will also induce cardiac slowing and AV conduction abnormalities.

Potassium Acid Phosphate

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(poe TASS ee um AS id FOS fate)

U.S. Brand NamesK-Phos® Original

Pharmacologic CategoryUrinary Acidifying Agent

Use: Labeled IndicationsAcidifies urine and lowers urinary calcium concentration; reduces odor and rash caused by ammoniacal urine; increases the antibacterial activity of methenamine

Dosing: Adults**Urine acidification:** Oral: 1000 mg dissolved in 6-8 oz of water 4 times/day with meals and at bedtime; for best results, soak tablets in water for 2-5 minutes, then stir and swallow

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsMay be taken with meals.

ContraindicationsSevere renal impairment; hyperkalemia, hyperphosphatemia; infected magnesium ammonium phosphate stones

Warnings/Precautions

Concerns related to adverse effects:

- GI effects: May cause GI upset (eg, nausea, vomiting, diarrhea, abdominal pain, discomfort) and lead to GI ulceration, bleeding, perforation and/or obstruction.
- Hyperkalemia: Close monitoring of serum potassium concentrations is needed to avoid hyperkalemia; severe hyperkalemia may lead to muscle weakness/paralysis and cardiac conduction abnormalities (eg, heart block, ventricular arrhythmias, asystole).

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; monitor serum potassium concentrations closely. Contraindicated with severe impairment.
- Tissue breakdown: Use with caution in patients with severe tissue breakdown (eg, chemotherapy or hemodialysis).

Concurrent drug therapy issues:

- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEI, potassium-sparing diuretics, potassium containing salt substitutes).

Geriatric ConsiderationsA complete drug history should be taken to rule out potential drug interactions since the elderly frequently may be taking potassium and potassium-sparing diuretics, salicylates, or antacids. Use with caution in renal impairment (low Cl_{cr}).

Pregnancy Risk FactorC

Adverse Reactions

>10%: Gastrointestinal: Diarrhea, nausea, stomach pain, flatulence, vomiting

1% to 10%:

Cardiovascular: Bradycardia

Endocrine & metabolic: Hyperkalemia

Local: Local tissue necrosis with extravasation

Neuromuscular & skeletal: Weakness

Respiratory: Dyspnea

<1%: Abdominal pain, alkalosis, arrhythmia, arthralgia, bone pain, chest pain, decreased urine output, dyspnea, edema, weight gain, hyperphosphatemia, hypocalcemia, mental confusion, pain of extremities, paralysis, paresthesia, phlebitis, tetany, thirst, throat pain, weakness of extremities

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Medication Safety Issues

Sound-alike/look-alike issues:

Kaon-Cl-10® may be confused with kaolin

KCl may be confused with HCl

K-Lor® may be confused with Klor-Con®

Klor-Con® may be confused with Klaron®, K-Lor®

microK® may be confused with Micronase®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Per JCAHO recommendations, concentrated electrolyte solutions should not be available in patient care areas.

Consider special storage requirements for intravenous potassium salts; I.V. potassium salts have been administered IVP in error, leading to fatal outcomes.

Pronunciation(poe TASS ee um KLOR ide)

U.S. Brand NamesK-Lor®; K-Tab®; Kaon-Cl-10®; Kay Ciel® [DSC]; Klor-Con®; Klor-Con® 10; Klor-Con® 8; Klor-Con® M; Klor-Con®/25; microK®; microK® 10

Canadian Brand NamesApo-K®; K-10®; K-Dur®; K-Lor®; K-Lyte®/Cl; Micro-K Extencaps®; Roychlor®; Slo-Pot; Slow-K®

Pharmacologic CategoryElectrolyte Supplement, Oral; Electrolyte Supplement, Parenteral

Use: Labeled IndicationsTreatment or prevention of hypokalemia

Dosing: AdultsI.V. doses should be incorporated into the patient's maintenance I.V. fluids; intermittent I.V. potassium administration should be reserved for severe depletion situations in patients undergoing ECG monitoring. Doses expressed as mEq of potassium.

Normal daily requirements:*Oral, I.V.:* 40-80 mEq/day

Prevention of hypokalemia:*Oral:* 20-40 mEq/day in 1-2 divided doses

Treatment of hypokalemia:

Oral:

Asymptomatic, mild hypokalemia: Usual dosage range: 40-100 mEq/day divided in 2-5 doses; generally recommended to limit doses to 20-25 mEq/dose to avoid GI discomfort.

Mild-to-moderate hypokalemia: Some clinicians may administer up to 120-240 mEq/day divided in 3-4 doses; limit doses to 40-60 mEq/dose. If deficits are severe or ongoing losses are great, I.V. route should be considered.

I.V. intermittent infusion: Peripheral or central line: ≤10 mEq/hour; repeat as needed based on frequently obtained lab values; central line infusion and continuous ECG monitoring highly recommended for infusions >10 mEq/hour.

Potassium dosage/rate of infusion general guidelines (per product labeling): **Note:** High variability exists in dosing/infusion rate recommendations; therapy guided by patient condition and specific institutional guidelines.

Serum potassium >2.5 mEq/L: Maximum infusion rate: 10 mEq/hour; maximum concentration: 40 mEq/L; maximum 24-hour dose: 200 mEq

Serum potassium <2 mEq/L and symptomatic (excluding emergency treatment of cardiac arrest): Maximum infusion rate (central line only): 40 mEq/hour in presence of continuous ECG monitoring and frequent lab monitoring; In selected situations, patients may require up to 400 mEq/24 hours.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricI.V. doses should be incorporated into the patient's maintenance I.V. fluids; intermittent I.V. potassium administration should be reserved for severe depletion situations in patients undergoing ECG monitoring. Doses expressed as mEq of potassium.

Normal daily requirements:*Oral, I.V.:* 1-2 mEq/kg/day

Prevention of hypokalemia: *Oral:* 1-2 mEq/kg/day in 1-2 divided doses

Treatment of hypokalemia:

Oral: 1-2 mEq/kg initially, then as needed based on frequently obtained lab values. If deficits are severe or ongoing losses are great, I.V. route should be considered.

I.V. intermittent infusion: 0.5-1 mEq/kg/dose (maximum dose: 40 mEq). If infusion exceeds 0.5 mEq/kg/hour, physician should be at bedside and patient should have continuous ECG monitoring; repeat as needed based on frequently obtained lab values.

Administration: I.V.Potassium must be diluted prior to parenteral administration. Do not administer I.V. push. In general, the dose, concentration of infusion and rate of administration may be dependant on patient condition and specific institution policy. Some clinicians recommend that the maximum concentration for peripheral infusion is 10 mEq/100 mL and maximum rate of administration for peripheral infusion is 10 mEq/hour. ECG monitoring is recommended for peripheral or central infusions >10 mEq/hour in adults. Concentrations and rates of infusion may be greater with central line administration. Some clinicians recommend that the maximum concentration for central infusion is 20-40 mEq/100 mL and maximum rate of administration for central infusion is 40 mEq/hour.

Administration: OralOral dosage forms should be taken with meals and a full glass of water or other liquid.

Capsule: MicroK®: Swallow whole, do not chew. Capsules may also be opened and contents sprinkled on a spoonful of applesauce or pudding and should be swallowed immediately without chewing. No more than 20 mEq should be given as a single dose.

Powder: Klor-Con®: Dissolve in 4-5 ounces of water or other beverage prior to administration.

Tablet: K-Tab®, Kaon-Cl®, Klor-Con®: Swallow tablets whole; do not crush, chew or suck on tablet. No more than 20 mEq should be given as a single dose.

Klor-Con® M: Tablet may also be broken in half and each half swallowed separately; the whole tablet may be dissolved in ~4 ounces of water (allow ~2 minutes to dissolve, stir well and drink immediately)

Dietary ConsiderationsAdminister with plenty of fluid to decrease stomach irritation and discomfort. Some dietary sources of potassium include leafy green vegetables (eg, spinach, cabbage), tomatoes, cucumbers, zucchini, fruits (eg, apples, oranges, and bananas), root vegetables (eg, carrots, radishes), beans, and peas.

Storage

Capsule: MicroK®: Store between 20°C to 25°C (68°F to 77°F).

Powder for oral solution: Klor-Con®: Store at room temperature of 15°C to 30°C (59°F to 86°F).

Solution for injection: Store at room temperature; do not freeze. Use only clear solutions. Use admixtures within 24 hours.

Tablet: K-Tab®: Store below 30°C (86°F).

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, $D_{20}W$, LR, ${}^1/_2NS$, NS, sodium chloride 3%; **variable compatibility (consult detailed reference)** in fat emulsion 10%, mannitol.

Y-site administration: Compatible: Acyclovir, alatrofloxacin, aldesleukin, allopurinol, amifostine, aminophylline, amiodarone, ampicillin, atropine, aztreonam, betamethasone sodium phosphate, calcium gluconate, chlordiazepoxide, chlorpromazine, ciprofloxacin, cisatracurium, cladribine, clarithromycin, cyanocobalamin, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, droperidol, edrophonium, enalaprilat, epinephrine, esmolol, estrogens (conjugated), ethacrynate, etoposide, famotidine, fentanyl, fentanyl and droperidol, filgrastim, fludarabine, fluorouracil, furosemide, gatifloxacin, gemcitabine, granisetron, heparin, hydralazine, idarubicin, inamrinone, indomethacin, insulin (regular), isoproterenol, kanamycin, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, menadiol, meperidine, methoxamine, methylergonovine, midazolam, milrinone, minocycline, morphine, neostigmine, norepinephrine, ondansetron, oxacillin, oxytocin, paclitaxel, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, procainamide, prochlorperazine edisylate, propofol, propranolol, pyridostigmine, remifentanil, sargramostim, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, tirofiban, trimethaphan, trimethobenzamide, vinorelbine, warfarin, zidovudine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, diazepam, ergotamine, phenytoin. **Variable (consult detailed reference):** Methylprednisolone sodium succinate, promethazine.

Compatibility when admixed: Compatible: Aminophylline, amiodarone, atracurium, bretylium, calcium gluconate, cefepime, ceftazidime, chloramphenicol, cimetidine, ciprofloxacin, clindamycin, corticotropin, cytarabine, dimenhydrinate, dopamine, enalaprilat, erythromycin lactobionate, floxacillin, fluconazole, foscarnet, fosphenytoin, furosemide, heparin, hydrocortisone sodium succinate, hydrocortisone sodium succinate with isoproterenol, lidocaine, metaraminol, methyldopate, metoclopramide, mitoxantrone, nafcillin, norepinephrine, oxacillin, penicillin G potassium, penicillin G potassium with vitamin B complex with C, phenylephrine, piperacillin, propafenone, ranitidine, sodium bicarbonate, thiopental, vancomycin, verapamil, vitamin B complex with C. **Incompatible:** Amphotericin B. **Variable (consult detailed reference):** Amikacin, dobutamine, etoposide with cisplatin and mannitol, penicillin G sodium.

ContraindicationsHypersensitivity to any component of the formulation; hyperkalemia. In addition, solid oral dosage forms are contraindicated in patients in whom there is a structural, pathological, and/or pharmacologic cause for delay or arrest in passage through the GI tract.

Warnings/Precautions

Concerns related to adverse effects:

- Hyperkalemia: Close monitoring of serum potassium concentrations is needed to avoid hyperkalemia; severe hyperkalemia may lead to muscle weakness/paralysis and cardiac conduction abnormalities (eg, heart block, ventricular arrhythmias, asystole).

Disease-related concerns:

- Acid/base disorders: Use with caution in patients with acid/base alterations; changes in serum potassium concentrations can occur during acid/base correction, monitor closely.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (eg, heart failure, cardiac arrhythmias); patients may be more susceptible to life-threatening cardiac effects associated with hyper/hypokalemia.

- Potassium-altering conditions/disorders: Use with caution in patients with disorders or conditions likely to contribute to altered serum potassium and hyperkalemia (eg, untreated Addison's disease, heat cramps, severe tissue breakdown from trauma or burns).
- Renal impairment: Use with caution in patients with renal impairment; monitor serum potassium concentrations closely. Contraindicated with severe impairment.

Concurrent drug therapy issues:

- Digitalis: Use with caution in digitalized patients; may be more susceptible to potentially life-threatening cardiac effects with rapid changes in serum potassium concentrations.
- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEI, potassium-sparing diuretics, potassium containing salt substitutes).

Dosage form specific issues:

- Oral formulations: May cause GI upset (eg, nausea, vomiting, diarrhea, abdominal pain, discomfort) and lead to GI ulceration, bleeding, perforation and/or obstruction. Oral liquid preparations (not solid) should be used in patients with esophageal compression or delayed gastric emptying.

Other warnings/precautions:

- Parenteral administration: Use extreme caution with parenteral administration and monitor serum potassium concentrations closely. Evaluate renal function, cardiac and fluid status, and any factors contributing to altered potassium concentrations (eg, acidosis, alkalosis) prior to therapy. Do **NOT** administer undiluted or I.V. push; inappropriate parenteral administration may be fatal. Always administer potassium further diluted; refer to appropriate dilution and administration rate recommendations. Pain and phlebitis may occur during parenteral infusion requiring a decrease in infusion rate or potassium concentration. Avoid administering potassium diluted in dextrose solutions during initial therapy; potential for transient decreases in serum potassium due to intracellular shift of potassium from dextrose-stimulated insulin release.

Geriatric ConsiderationsElderly may require less potassium than younger adults due to decreased renal function. For the elderly who do not respond to replacement therapy, check serum magnesium. Long-term use of diuretics may result in hypomagnesemic.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Potassium supplementation (that does not cause maternal hyperkalemia) would not be expected to cause adverse fetal events.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsThe normal content of potassium in human milk is ~13 mEq/L. Supplementation (that does not cause maternal hyperkalemia) would not be expected to affect normal levels.

Adverse ReactionsFrequency not defined.

Dermatologic: Rash

Endocrine & metabolic: Hyperkalemia

Gastrointestinal: Abdominal pain/discomfort, diarrhea, flatulence, GI bleeding (oral), GI obstruction (oral), GI perforation (oral), nausea, vomiting

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Anticholinergic Agents: May enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Monitoring ParametersSerum potassium, glucose, chloride, pH, urine output (if indicated), cardiac monitor (if intermittent infusion or potassium infusion rates 0.5 mEq/kg/hour in children or >10 mEq/hour in adults)

Nursing: Physical Assessment/MonitoringAssess therapeutic response and adverse effects.

Monitoring: Lab TestsSerum potassium, glucose, chloride

Patient EducationLong-acting and wax matrix tablets should be swallowed whole; do not crush or chew. Powder must be dissolved in water before use. Liquid can be diluted or dissolved in water or juice. Take with food to avoid GI irritation and upset. Report abdominal pain, vomiting, blood in urine or stool, or persistent nausea or vomiting. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, extended release, microencapsulated: 8 mEq [600 mg]; 10 mEq [750 mg]

microK®: 8 mEq [600 mg]

microK® 10: 10 mEq [750 mg]

Infusion [premixed in D_5W]: 20 mEq (1000 mL); 30 mEq (1000 mL); 40 mEq (1000 mL)

Infusion [premixed in D_5W and LR]: 20 mEq (1000 mL); 30 mEq (1000 mL); 40 mEq (1000 mL)

Infusion [premixed in D_5W and sodium chloride 0.2%]: 5 mEq (250 mL); 10 mEq (500 mL, 1000 mL); 20 mEq (1000 mL); 30 mEq (1000 mL); 40 mEq (1000 mL)

Infusion [premixed in D_5W and sodium chloride 0.225%: 10 mEq (500 mL, 1000 mL); 20 mEq (1000 mL); 30 mEq (1000 mL); 40 mEq (1000 mL)

Infusion [premixed in D_5W and sodium chloride 0.3%]: 10 mEq (500 mL); 20 mEq (1000 mL)

Infusion [premixed in D_5W and sodium chloride 0.33%]: 10 mEq (500 mL); 20 mEq (1000 mL)

Infusion [premixed in D_5W and sodium chloride 0.45%]: 10 mEq (500 mL, 1000 mL); 20 mEq (1000 mL); 30 mEq (1000 mL); 40 mEq (1000 mL)

Infusion [premixed in D_5W and NS]: 20 mEq (1000 mL); 40 mEq (1000 mL)

Infusion [premixed in $D_{10}W$ and sodium chloride 0.2%]: 5 mEq (250 mL)

Infusion [premixed in sodium chloride 0.45%]: 20 mEq (1000 mL); 40 mEq (1000 mL)

Infusion [premixed in NS]: 20 mEq (1000 mL); 40 mEq (1000 mL)

Infusion [premixed in SWFI; highly concentrated]: 10 mEq (50 mL, 100 mL); 20 mEq (50 mL, 100 mL); 30 mEq (100 mL); 40 mEq (100 mL)

Injection, solution [concentrate]: 2 mEq/mL (5 mL, 10 mL, 15 mL, 20 mL, 30 mL, 250 mL, 500 mL)

Powder, for oral solution: 20 mEq/packet (30s, 100s, 1000s)

K-Lor™: 20 mEq/packet (30s, 100s) [fruit flavor]

Kay Ciel® 10%: 20 mEq/packet (30s, 100s) [sugar free] [DSC]

Klor-Con®: 20 mEq/packet (30s, 100s) [sugar free; fruit flavor]

Klor-Con®/25: 25 mEq/packet (30s, 100s) [sugar free; fruit flavor]

Solution, oral: 20 mEq/15 mL (15 mL, 30 mL, 480 mL, 3840 mL); 40 mEq/15 mL (15 mL, 480 mL)

Tablet, extended release: 8 mEq [600 mg]; 10 mEq [750 mg]; 20 mEq [1500 mg]

K-Tab®: 10 mEq [750 mg]

Mechanism of ActionPotassium is the major cation of intracellular fluid and is essential for the conduction of nerve impulses in heart, brain, and skeletal muscle; contraction of cardiac, skeletal and smooth muscles; maintenance of normal renal function, acid-base balance, carbohydrate metabolism, and gastric secretion

Pharmacodynamics/Kinetics

Absorption: Well absorbed from upper GI tract

Distribution: Enters cells via active transport from extracellular fluid

Excretion: Primarily urine; skin and feces (small amounts); most intestinal potassium reabsorbed

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause GI side effects; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects. Anticholinergic agents (many psychotropics possess anticholinergic activity) may enhance the ulcerogenic effects of potassium chloride.

Cardiovascular ConsiderationsHypokalemia is highly arrhythmogenic, particularly in the setting of ischemia or digitalis toxicity. ECG evidence of hypokalemia includes flattening of the T wave. As the T wave shrinks, U waves may appear. There is no prolongation of the QT interval. Hyperkalemia may present as tall peaked symmetrical T waves. S-T elevation may present in severe hyperkalemia. QRS complex progressively widens with eventual apparent sine waves on the ECG. Hyperkalemia will also induce cardiac slowing and AV conduction abnormalities.

Index TermsKCl

Potassium Citrate and Citric Acid

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(poe TASS ee um SIT rate & SI trik AS id)
U.S. Brand NamesCytra-K; Polycitra®-K
Pharmacologic CategoryAlkalinizing Agent, Oral
Use: Labeled IndicationsTreatment of metabolic acidosis; alkalinizing agent in conditions where long-term maintenance of an alkaline urine is desirable
Dosing: Adults**Urine alkalizing agent:** Oral:

Powder: One packet dissolved in water after meals and at bedtime; adjust dose to urinary pH

Solution: 15-30 mL after meals and at bedtime; adjust dose based on urinary pH

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Urine alkalizing agent:** Oral: Solution: 5-15 mL after meals and at bedtime; adjust dose based on urinary pH
Administration: OralDilute with water prior to administration; doses may be chilled to improve palatability. Follow dose with additional water or juice.
StorageStore at controlled room temperature. Protect from excessive heat or freezing. Diluted formulations may be refrigerated to improve palatability.
Reconstitution

Powder: Dilute contents of each packet with at least 6 ounces of water.

Solution: Dilute each dose with water (at least 6 ounces for adults doses).

ContraindicationsSevere renal insufficiency, oliguria, or azotemia; potassium-restricted diet; untreated Addison's disease; adynamia episodica hereditaria; acute dehydration; heat cramps; anuria; severe myocardial damage; hyperkalemia from any cause
Warnings/Precautions

Concerns related to adverse effects:

- GI effects: May cause GI upset (eg, nausea, vomiting, diarrhea, abdominal pain, discomfort) and lead to GI ulceration, bleeding, perforation and/or obstruction.
- Hyperkalemia: Close monitoring of serum potassium concentrations is needed to avoid hyperkalemia; severe hyperkalemia may lead to muscle weakness/paralysis and cardiac conduction abnormalities (eg, heart block, ventricular arrhythmias, asystole).

Disease-related concerns:

- Acid/base disorders: Use with caution in patients with acid/base alterations; changes in serum potassium concentrations can occur during acid/base correction, monitor closely.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (eg, heart failure, cardiac arrhythmias); patients may be more susceptible to life-threatening cardiac effects associated with hyper/hypokalemia.
- Hepatic impairment: Citrate is converted to bicarbonate in the liver; this conversion may be blocked in patients in hepatic failure.
- Potassium-altering conditions/disorders: Use with caution in patients with disorders or conditions likely to contribute to altered serum potassium and hyperkalemia (eg, untreated Addison's disease, heat cramps, severe tissue breakdown from trauma or burns).
- Renal impairment: Use with caution in patients with renal impairment; monitor serum potassium concentrations closely. Contraindicated with severe impairment.
- Severely ill: Citrate is converted to bicarbonate in the liver; this conversion may be blocked in patients who are severely ill or in shock.

Concurrent drug therapy issues:

- Digitalis: Use with caution in digitalized patients; may be more susceptible to potentially life-threatening cardiac effects with rapid changes in serum potassium concentrations.
- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEI, potassium-sparing diuretics, potassium containing salt substitutes).

Pregnancy Risk FactorA
LactationExcretion in breast milk unknown/compatible
Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aluminum Hydroxide: Citric Acid Derivatives may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/Monitoring

See individual agent for Potassium Citrate.

Monitoring: Lab TestsSerum potassium, serum bicarbonate

Patient Education

See individual agent for Potassium Citrate.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Equivalent to potassium 2 mEq/mL and bicarbonate 2 mEq/mL

Powder for solution, oral:

Cytra-K: Potassium citrate monohydrate 3300 mg and citric acid 1002 mg per packet (100s) [sugar free; fruit flavor]

Polycitra®-K: Potassium citrate monohydrate 3300 mg and citric acid 1002 mg per packet (100s) [sugar free]

Solution:

Cytra-K: Potassium citrate monohydrate 1100 mg and citric acid monohydrate 334 mg per 5 mL (480 mL) [alcohol free, sugar free; contains sodium benzoate; berry citrus flavor]

Polycitra®-K: Potassium citrate monohydrate 1100 mg and citric acid monohydrate 334 mg per 5 mL (480 mL) [alcohol free, sugar free]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Pack (Cytra K Crystals)

1002-3300 mg (100): $85.50

Solution (Cytra-K)

1100-334 mg/5 mL (473): $21.00

Solution (Polycitra-K)

1100-334 mg/5 mL (473): $45.98

Pharmacodynamics/Kinetics

Metabolism: To potassium bicarbonate; citric acid is metabolized to CO_2 and H_2O

Excretion: Urine

Related Information

- Potassium Citrate

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Mental Health CommentHypokalemia is associated with an increased risk of ventricular dysrhythmias; use antipsychotics with caution (especially ziprasidone).

Cardiovascular ConsiderationsHypokalemia is highly arrhythmogenic, particularly in the setting of ischemia or digitalis toxicity. ECG evidence of hypokalemia includes flattening of the T wave. As the T wave shrinks, U waves may appear. There is no prolongation of the QT interval. Hyperkalemia may present as tall peaked symmetrical T waves. S-T elevation may present in severe hyperkalemia. QRS complex progressively widens with eventual apparent sine waves on the ECG. Hyperkalemia will also induce cardiac slowing and AV conduction abnormalities.

Medication Safety Issues

Sound-alike/look-alike issues:

Urocit®-K may be confused with Urised®

Pronunciation(poe TASS ee um SIT rate)
U.S. Brand NamesUrocit®-K
Canadian Brand NamesK-Citra®; K-Lyte®; Polycitra®-K
Pharmacologic CategoryAlkalinizing Agent
Use: Labeled IndicationsPrevention of uric acid nephrolithiasis; prevention of calcium renal stones in patients with hypocitraturia; urinary alkalinizer when sodium citrate is contraindicated
Dosing: Adults**Alkalinizer, bicarbonate precursor:** Oral: 10-20 mEq 3 times/day with meals up to 100 mEq/day
Dosing: ElderlyRefer to adult dosing.
Administration: OralSwallow tablets whole with a full glass of water.
Dietary ConsiderationsMay be taken with meals.
StorageStore in a cool, dry place.
ContraindicationsSevere renal insufficiency; sodium-restricted diet (sodium citrate); untreated Addison's disease; severe myocardial damage; acute dehydration; patients with hyperkalemia; patients with delayed gastric emptying, esophageal compression, intestinal obstruction or stricture, or those taking anticholinergic medication; patients with active urinary tract infection
Warnings/Precautions

Concerns related to adverse effects:

- GI effects: May cause GI upset (eg, nausea, vomiting, diarrhea, abdominal pain, discomfort) and lead to GI ulceration, bleeding, perforation and/or obstruction. Oral liquid preparations (not solid) should be used in patients with esophageal compression or delayed gastric emptying.

- Hyperkalemia: Close monitoring of serum potassium concentrations is needed to avoid hyperkalemia; severe hyperkalemia may lead to muscle weakness/paralysis and cardiac conduction abnormalities (eg, heart block, ventricular arrhythmias, asystole).

Disease-related concerns:

- Acid/base disorders: Use with caution in patients with acid/base alterations; changes in serum potassium concentrations can occur during acid/base correction, monitor closely.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (eg, heart failure, cardiac arrhythmias); patients may be more susceptible to life-threatening cardiac effects associated with hyper/hypokalemia.

- Hepatic impairment: Citrate is converted to bicarbonate in the liver; this conversion may be blocked in patients in hepatic failure.

- Potassium-altering conditions/disorders: Use with caution in patients with disorders or conditions likely to contribute to altered serum potassium and hyperkalemia (eg, untreated Addison's disease, heat cramps, severe tissue breakdown from trauma or burns).

- Renal impairment: Use with caution in patients with renal impairment; monitor serum potassium concentrations closely. Contraindicated with severe impairment.

- Severely ill: Citrate is converted to bicarbonate in the liver; this conversion may be blocked in patients who are severely ill or in shock.

Concurrent drug therapy issues:

- Digitalis: Use with caution in digitalized patients; may be more susceptible to potentially life-threatening cardiac effects with rapid changes in serum potassium concentrations.

- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEI, potassium-sparing diuretics, potassium containing salt substitutes).

LactationEnters breast milk/compatible
Adverse Reactions

>10%: Gastrointestinal: Diarrhea, nausea, stomach pain, flatulence, vomiting (oral)

1% to 10%:

Cardiovascular: Bradycardia

Endocrine & metabolic: Hyperkalemia, metabolic alkalosis in patients with severe renal failure

Neuromuscular & skeletal: Weakness

Respiratory: Dyspnea

<1% (Limited to important or life-threatening): Arrhythmias, chest pain, heart block, hypotension

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aluminum Hydroxide: Citric Acid Derivatives may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/Monitoring Assess effectiveness and interactions of other medications patient may be taking. Assess kidney function prior to starting therapy. Monitor cardiac status and serum potassium at beginning of therapy and at regular intervals with long-term therapy. Assess knowledge/teach patient appropriate use, recommended diet, and adverse symptoms to report.

Monitoring: Lab Tests Serum potassium, serum bicarbonate

Patient Education Take as directed; do not take more than directed. Swallow tablet whole with full glass of water or juice and stir before sipping slowly, with or after meals (do not take on an empty stomach). Take any antacids 2 hours before or after potassium. Consult prescriber about advisability of increasing dietary potassium. Report tingling of hands or feet; unresolved nausea or vomiting; chest pain or palpitations; persistent abdominal pain; feelings of weakness, dizziness, listlessness, confusion; acute muscle weakness or cramping; blood in stool or tarry stools; or easy bruising or unusual bleeding.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 540 mg [5 mEq]; 1080 mg [10 mEq]

Urocit®-K: 540 mg [5 mEq]; 1080 mg [10 mEq]

Tablet, extended release: 540 mg [5 mEq]; 1080 mg [10 mEq]

Generic Available Yes

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Potassium Citrate)

540 mg (100): $28.99

1080 mg (90): $34.99

Tablet, controlled release (Urocit-K 10)

1080 mg (100): $57.99

Tablet, controlled release (Urocit-K 5)

540 mg (100): $43.99

Pharmacodynamics/Kinetics Metabolism: Hepatic to bicarbonate

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Contraindicated in patients receiving anticholinergic medications. GI side effects are common; use caution with SSRIs, lithium, and valproic acid.

Mental Health Comment Hypokalemia is associated with an increased risk of ventricular dysrhythmias; use antipsychotics with caution (especially ziprasidone).

Cardiovascular Considerations Hypokalemia is highly arrhythmogenic, particularly in the setting of ischemia or digitalis toxicity. ECG evidence of hypokalemia includes flattening of the T wave. As the T wave shrinks, U waves may appear. There is no prolongation of the QT interval. Hyperkalemia may present as tall peaked symmetrical T waves. S-T elevation may present in severe hyperkalemia. QRS complex progressively widens with eventual apparent sine waves on the ECG. Hyperkalemia will also induce cardiac slowing and AV conduction abnormalities.

Potassium Gluconate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(poe TASS ee um GLOO coe nate)

Pharmacologic CategoryElectrolyte Supplement, Oral

Use: Labeled IndicationsTreatment or prevention of hypokalemia

Dosing: Adults**Note:** Doses listed as mEq of potassium:

Normal daily requirement: Oral: 40-80 mEq/day

Prevention of hypokalemia during diuretic therapy: Oral: 16-24 mEq/day in 1-2 divided doses

Treatment of hypokalemia: Oral: 40-100 mEq/day in 2-4 divided doses

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Doses listed as mEq of potassium:

Normal daily requirement: Oral: 2-3 mEq/kg/day

Prevention of hypokalemia during diuretic therapy: Oral: 1-2 mEq/kg/day in 1-2 divided doses

Treatment of hypokalemia: Oral: 2-5 mEq/kg/day in 2-4 divided doses

StorageStore at room temperature.

ContraindicationsSevere renal impairment, untreated Addison's disease, heat cramps, hyperkalemia, severe tissue trauma; solid oral dosage forms are contraindicated in patients in whom there is a structural, pathological, and/or pharmacologic cause for delay or arrest in passage through the GI tract

Warnings/Precautions

Concerns related to adverse effects:

- GI effects: May cause GI upset (eg, nausea, vomiting, diarrhea, abdominal pain, discomfort) and lead to GI ulceration, bleeding, perforation and/or obstruction. Oral liquid preparations (not solid) should be used in patients with esophageal compression or delayed gastric emptying.

- Hyperkalemia: Close monitoring of serum potassium concentrations is needed to avoid hyperkalemia; severe hyperkalemia may lead to muscle weakness/paralysis and cardiac conduction abnormalities (eg, heart block, ventricular arrhythmias, asystole).

Disease-related concerns:

- Acid/base disorders: Use with caution in patients with acid/base alterations; changes in serum potassium concentrations can occur during acid/base correction, monitor closely.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (eg, heart failure, cardiac arrhythmias); patients may be more susceptible to life-threatening cardiac effects associated with hyper/hypokalemia.

- Potassium-altering conditions/disorders: Use with caution in patients with disorders or conditions likely to contribute to altered serum potassium and hyperkalemia (eg, untreated Addison's disease, heat cramps, severe tissue breakdown from trauma or burns).

- Renal impairment: Use with caution in patients with renal impairment; monitor serum potassium concentrations closely. Contraindicated with severe impairment.

Concurrent drug therapy issues:

- Digitalis: Use with caution in digitalized patients; may be more susceptible to potentially life-threatening cardiac effects with rapid changes in serum potassium concentrations.

- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEI, potassium-sparing diuretics, potassium containing salt substitutes).

Geriatric ConsiderationsElderly may require less potassium than younger adults due to decreased renal function. For the elderly who do not respond to replacement therapy, check serum magnesium. Long-term use of diuretics may result in hypomagnesemia.

Pregnancy Risk FactorA

Adverse Reactions

>10%: Gastrointestinal: Diarrhea, nausea, stomach pain, flatulence, vomiting (oral)

1% to 10%:

Cardiovascular: Bradycardia

Endocrine & metabolic: Hyperkalemia

Neuromuscular & skeletal: Weakness

Respiratory: Dyspnea

<1%: Alkalosis, chest pain, mental confusion, paralysis, paresthesia, phlebitis, throat pain

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Test Interactions Decreased ammonia (B)

Monitoring Parameters Serum potassium, chloride, glucose, pH, urine output (if indicated)

Monitoring: Lab Tests Serum potassium

Patient Education Take with food, water, or fruit juice. Swallow tablets whole; do not crush or chew.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet: 595 mg [equivalent to potassium 99 mg]

Capsule: 99 mg [strength expressed as base]

Tablet: 99 mg [strength expressed as base]; 550 mg [equivalent to potassium 90 mg]; 595 mg [equivalent to potassium 99 mg]

Tablet, timed release: 95 mg [strength expressed as base]

Generic Available Yes

Mechanism of Action Potassium is the major cation of intracellular fluid and is essential for the conduction of nerve impulses in heart, brain, and skeletal muscle; contraction of cardiac, skeletal and smooth muscles; maintenance of normal renal function, acid-base balance, carbohydrate metabolism, and gastric secretion

Pharmacodynamics/Kinetics

Absorption: Well absorbed from upper GI tract

Distribution: Enters cells via active transport from extracellular fluid

Excretion: Primarily urine; skin and feces (small amounts); most intestinal potassium reabsorbed

Pharmacotherapy Pearls9.4 g potassium gluconate is approximately equal to 40 mEq potassium (4.3 mEq potassium/g potassium gluconate).

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Cardiovascular Considerations Hypokalemia is highly arrhythmogenic, particularly in the setting of ischemia or digitalis toxicity. ECG evidence of hypokalemia includes flattening of the T wave. As the T wave shrinks, U waves may appear. There is no prolongation of the QT interval. Hyperkalemia may present as tall peaked symmetrical T waves. S-T elevation may present in severe hyperkalemia. QRS complex progressively widens with eventual apparent sine waves on the ECG. Hyperkalemia will also induce cardiac slowing and AV conduction abnormalities.

International Brand Names Ion-K (CO); Kalium gluconicum (PL); Ultra-K (BE)

Potassium Iodide and Iodine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues
Sound-alike/look-alike issues:

Potassium iodide and iodine (Strong Iodide Solution or Lugol's solution) may be confused with potassium iodide products, including saturated solution of potassium iodide (SSKI®)

Pronunciation(poe TASS ee um EYE oh dide & EYE oh dine)
Pharmacologic CategoryAntithyroid Agent
Use: Labeled IndicationsReduce thyroid vascularity prior to thyroidectomy and management of thyrotoxic crisis; block thyroidal uptake of radioactive isotopes of iodine in a radiation emergency or other exposure to radioactive iodine
Dosing: Adults**RDA**, Adults: 150 mcg (iodine)
Preoperative thyroidectomy: Oral: 0.1-0.3 mL (3-5 drops) of strong iodine (Lugol's solution) 3 times/day; administer for 10 days before surgery

Thyrotoxic crisis: Oral: 1 mL strong iodine (Lugol's solution) 3 times/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Refer to adult dosing.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light and keep container tightly closed.
ContraindicationsHypersensitivity to iodine or any component of the formulation; hyperkalemia; pulmonary edema; impaired renal function; hyperthyroidism; iodine-induced goiter; dermatitis herpetiformis; hypocomplementemic vasculitis
Warnings/Precautions

Concerns related to adverse effects:

- Hypothyroidism: Prolonged use can lead to hypothyroidism.

- Skin reactions: Can cause acne flare-ups and/ or dermatitis.

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with Addison's disease.

- Bronchitis: Use with caution in patients with acute bronchitis.

- Cardiac disease: Use with caution in patients with cardiac disease.

- Cystic fibrosis: May have an exaggerated response.

- Myotonia congenita: Use with caution in patients with myotonia congenita.

- Thyroid disease: Use with caution in patients with a history of thyroid disease.

- Tuberculosis: Use with caution in patients with tuberculosis.

Concurrent drug therapy issues:

- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEI, potassium-sparing diuretics, potassium containing salt substitutes).

Geriatric ConsiderationsElderly may have reduced renal function and require close monitoring of serum potassium. May be also recommended to check serum magnesium.
Pregnancy Risk FactorD (potassium iodide)
Pregnancy ConsiderationsIodide crosses the placenta (may cause hypothyroidism and goiter in fetus/newborn). Use for protection against thyroid cancer secondary to radioactive iodine exposure is considered acceptable based upon risk/benefit, keeping in mind the dose and duration. Repeat dosing should be avoided if possible. Refer to Iodine for additional information.
LactationEnters breast milk/use caution (AAP rates “compatible”)
Breast-Feeding ConsiderationsAAP considers this drug "compatible," but recommends avoiding breast-feeding following radioactive iodine exposure unless no alternative is available. Skin rash in the nursing infant has been reported with maternal intake of potassium iodide. Refer to Iodine monograph for additional information.
Adverse ReactionsFrequency not defined.
Cardiovascular: Irregular heart beat

Central nervous system: Confusion, tiredness, fever

Dermatologic: Skin rash

Endocrine & metabolic: Goiter, salivary gland swelling/tenderness, thyroid adenoma, swelling of neck/throat, myxedema, lymph node swelling, hyper-/hypothyroidism

Gastrointestinal: Diarrhea, gastrointestinal bleeding, metallic taste, nausea, stomach pain, stomach upset, vomiting

Neuromuscular & skeletal: Numbness, tingling, weakness, joint pain

Miscellaneous: Chronic iodine poisoning (with prolonged treatment/high doses); iodism, hypersensitivity reactions (angioedema, cutaneous and mucosal hemorrhage, serum sickness-like symptoms)

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Lithium: Potassium Iodide may enhance the adverse/toxic effect of Lithium. Specifically the hypothyroid/goiter-potentiating effects. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Sodium Iodide I131: Antithyroid Agents may diminish the therapeutic effect of Sodium Iodide I131. Management: Discontinue antithyroid therapy 3-4 days prior to sodium iodide I-131 administration. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antithyroid Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsMay alter thyroid function tests.

Monitoring Parameters

Thyroid function tests, signs/symptoms of hyperthyroidism; thyroid function should be monitored in pregnant women, neonates, and young infants if repeat doses are required following radioactive iodine exposure

Nursing: Physical Assessment/MonitoringUse caution in presence of history of thyroid disease, Addison's disease, cardiac disease, myotonia congenital, tuberculosis, or acute bronchitis. Assess potential for interactions with other pharmacological agents or herbal products patient is taking that may increase risk of hyperkalemia, hypokalemia., or additive hypothyroid effects. Assess need for laboratory monitoring, therapeutic effects (according to purpose for use), and adverse reactions. Teach patient or caregiver purpose for use, necessity for contraception for sexually active female patients, possible side effects/appropriate interventions, and adverse symptoms to report (refer to Patient Education).

Patient EducationTake this medication exactly as directed; do not exceed recommended dosage. May cause metallic taste, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); soreness of teeth, gums, or glands (use soft toothbrush and frequent mouth rinses; fever, headache or sore joints (consult prescriber for approved analgesic); confusion or tiredness (use caution when driving or engaged in potential hazardous tasks until response to medication is known). Report immediately any swelling of lips, mouth, or tongue; difficulty swallowing; chest pain or irregular heartbeat; muscle weakness; eye irritation or eyelid swelling; skin rash or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause fetal defects. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral: Potassium iodide 100 mg/mL and iodine 50 mg/mL (480 mL)

Solution, topical: Potassium iodide 100 mg/mL and iodine 50 mg/mL (8 mL)

Generic AvailableYes

Mechanism of ActionInhibits secretion of thyroid hormone, fosters colloid accumulation in thyroid follicles. Following radioactive iodine exposure, potassium iodide blocks uptake of radioiodine by the thyroid, reducing the risk of thyroid cancer.

Pharmacodynamics/Kinetics

Onset of action: Hyperthyroidism: 24-48 hours

Peak effect: 10-15 days after continuous therapy

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or confusion

Mental Health: Effects on Psychiatric TreatmentConcurrent use with lithium may produce additive hypothyroid effects

Medication Safety Issues

Sound-alike/look-alike issues:

Potassium iodide products, including saturated solution of potassium iodide (SSKI®) may be confused with potassium iodide and iodine (Strong Iodide Solution or Lugol's solution)

Pronunciation(poe TASS ee um EYE oh dide)
U.S. Brand NamesIosat™ [OTC]; SSKI®; ThyroSafe™ [OTC]; ThyroShield™ [OTC]
Pharmacologic CategoryAntithyroid Agent; Expectorant
Use: Labeled IndicationsExpectorant for the symptomatic treatment of chronic pulmonary diseases complicated by mucous; reduce thyroid vascularity prior to thyroidectomy and management of thyrotoxic crisis; block thyroidal uptake of radioactive isotopes of iodine in a radiation emergency or other exposure to radioactive iodine
Use: Unlabeled/InvestigationalLymphocutaneous and cutaneous sporotrichosis
Dosing: Adults

RDA: 150 mcg (iodine)

Expectorant: Oral: *SSKI®:* 300-600 mg 3-4 times/day

Preoperative thyroidectomy: Oral: 50-250 mg (1-5 drops SSKI®) 3 times/day; administer for 10 days before surgery

To reduce risk of thyroid cancer following nuclear accident (Iosat™, ThyroSafe™, ThyroShield™): Oral: Children >68 kg and Adults (including pregnant/lactating women): Oral: 130 mg once daily. **Note:** Dosing should continue until risk of exposure has passed or other measures have are implemented.

Thyrotoxic crisis: Oral: 300-500 mg (6-10 drops SSKI®) 3 times/day

Sporotrichosis (cutaneous, lymphocutaneous; unlabeled use): Oral: Initial: 5 drops (SSKI®) 3 times/day; increase to 40-50 drops (SSKI®) 3 times/day as tolerated for 3-6 months

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Preoperative thyroidectomy: Refer to adult dosing.

To reduce risk of thyroid cancer following nuclear accident (Iosat™, ThyroSafe™, ThyroShield™): Oral:

Infants <1 month: 16.25 mg once daily

Children 1 month to 3 years: 32.5 mg once daily

Children 3-18 years: 65 mg once daily

Children >68 kg: Refer to adult dosing

Note: Dosing should continue until risk of exposure has passed or other measures are implemented.

Thyrotoxic crisis: Oral:

Infants <1 year: 150-250 mg (3-5 drops SSKI®) 3 times/day

Children: Refer to adult dosing.

Administration: OralSSKI®: Dilute in a glassful of water, fruit juice or milk. Take with food to decrease gastric irritation
Dietary ConsiderationsSSKI®: Take with food to decrease gastric irritation.
StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light. Keep tightly closed.

SSKI®: If exposed to cold, crystallization may occur. Warm and shake to redissolve. If solution becomes brown/yellow, it should be discarded.

Reconstitution

SSKI®: May be mixed in water, fruit juice, or milk.

Preparation of oral solution:

Concentration of 16.25 mg/5 mL oral solution: Crush one 130 mg tablet into a fine powder. Add 20 mL of water and mix until powder is dissolved. Add an additional 20 mL of low-fat milk (white or chocolate), orange juice, flat soda, raspberry syrup or infant formula. Final concentration will be 16.25 mg/5 mL. Stable for 7 days under refrigeration.

Concentration of 8.125 mg/5 mL oral solution: Crush one 65 mg tablet into a fine powder. Add 20 mL of water and mix until powder is dissolved. Add an additional 20 mL of low-fat milk (white or chocolate), orange juice, flat soda, raspberry syrup, or infant formula. Final concentration will be 8.125 mg/5 mL. Stable for 7 days under refrigeration.

Extemporaneously PreparedPreparation of oral solution:

Concentration of 16.25 mg/5 mL oral solution: Crush one 130 mg tablet into a fine powder. Add 20 mL of water and mix until powder is dissolved. Add an additional 20 mL of low-fat milk (white or chocolate), orange juice, flat soda, raspberry syrup or infant formula. Final concentration will be 16.25 mg/5 mL.

Concentration of 8.125 mg/5 mL oral solution: Crush one 65 mg tablet into a fine powder. Add 20 mL of water and mix until powder is dissolved. Add an additional 20 mL of low-fat milk (white or chocolate), orange juice, flat soda, raspberry syrup, or infant formula. Final concentration will be 8.125 mg/5 mL.

ContraindicationsHypersensitivity to iodine or any component of the formulation; hyperkalemia; pulmonary edema; impaired renal function; hyperthyroidism; iodine-induced goiter; dermatitis herpetiformis; hypocomplementemic vasculitis

Warnings/Precautions

Concerns related to adverse effects:

- Hypothyroidism: Prolonged use can lead to hypothyroidism.

- Skin reactions: Can cause acne flare-ups and/ or dermatitis.

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with Addison's disease.

- Bronchitis: Use with caution in patients with acute bronchitis.

- Cardiac disease: Use with caution in patients with cardiac disease.

- Cystic fibrosis: May have an exaggerated response.

- Myotonia congenita: Use with caution in patients with myotonia congenita.

- Thyroid disease: Use with caution in patients with a history of thyroid disease.

- Tuberculosis: Use with caution in patients with tuberculosis.

Concurrent drug therapy issues:

- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEI, potassium-sparing diuretics, potassium containing salt substitutes).

Pregnancy Risk FactorD

Pregnancy ConsiderationsIodide crosses the placenta (may cause hypothyroidism and goiter in fetus/newborn). Use as an expectorant during pregnancy is contraindicated by the AAP. Use for protection against thyroid cancer secondary to radioactive iodine exposure is considered acceptable based upon risk/benefit, keeping in mind the dose and duration. Repeat dosing should be avoided if possible. Refer to Iodine for additional information.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsAAP considers this drug compatible, but recommends avoiding breast-feeding following radioactive iodine exposure unless no alternative is available. May cause skin rash in nursing infant. Refer to Iodine for additional information.

Adverse ReactionsFrequency not defined.

Cardiovascular: Irregular heart beat

Central nervous system: Confusion, tiredness, fever

Dermatologic: Skin rash

Endocrine & metabolic: Goiter, salivary gland swelling/tenderness, thyroid adenoma, swelling of neck/throat, myxedema, lymph node swelling, hyper-/hypothyroidism

Gastrointestinal: Diarrhea, gastrointestinal bleeding, metallic taste, nausea, stomach pain, stomach upset, vomiting

Neuromuscular & skeletal: Numbness, tingling, weakness, joint pain

Miscellaneous: Chronic iodine poisoning (with prolonged treatment/high doses); iodism, hypersensitivity reactions (angioedema, cutaneous and mucosal hemorrhage, serum sickness-like symptoms)

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Lithium: Potassium Iodide may enhance the adverse/toxic effect of Lithium. Specifically the hypothyroid/goiter-potentiating effects. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Sodium Iodide I131: Antithyroid Agents may diminish the therapeutic effect of Sodium Iodide I131. Management: Discontinue antithyroid therapy 3-4 days prior to sodium iodide I-131 administration. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antithyroid Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsMay alter thyroid function tests.

Monitoring ParametersThyroid function tests, signs/symptoms of hyperthyroidism; thyroid function should be monitored in pregnant women, neonates, and young infants if repeat doses are required following radioactive iodine exposure

Nursing: Physical Assessment/MonitoringUse with caution in presence of history of thyroid disease, Addison's disease, cardiac disease, myotonia congenital, tuberculosis, or acute bronchitis. Teach patient purpose for use, necessity for contraception, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsThyroid function

Patient EducationTake this medication exactly as directed; do not exceed recommended dosage. Dilute SSKI® in glassful of water, fruit juice, or milk with meals to reduce gastric irritation. May cause metallic taste, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); soreness of teeth, gums, or glands (use soft toothbrush and frequent mouth rinses); fever, headache or sore joints (consult prescriber for approved analgesic); confusion or tiredness (use caution when driving or engaged in potential hazardous tasks until response to medication is known). Discontinue and report any swelling of lips, mouth, or tongue; difficulty swallowing; chest pain or irregular heartbeat; unusual muscle weakness; eye irritation or eyelid swelling; skin rash or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause fetal defects. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

SSKI®: 1 g/mL (30 mL, 240 mL) [contains sodium thiosulfate]

ThyroShield™: 65 mg/mL (30 mL) [black raspberry flavor]

Tablet:

Iosat™: 130 mg

ThyroSafe™: 65 mg [equivalent to iodine 50 mg]

Pricing: U.S. (www.drugstore.com)

Solution (SSKI)

1 g/mL (237): $55.98

Mechanism of ActionReduces viscosity of mucus by increasing respiratory tract secretions; inhibits secretion of thyroid hormone, fosters colloid accumulation in thyroid follicles. Following radioactive iodine exposure, potassium iodide blocks uptake of radioiodine by the thyroid, reducing the risk of thyroid cancer.

Pharmacodynamics/Kinetics

Onset of action: Hyperthyroidism: 24-48 hours

Peak effect: 10-15 days after continuous therapy

Duration: Radioactive iodine exposure: ~24 hours

Pharmacotherapy Pearls10 drops of SSKI® = potassium iodide 500 mg

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConcurrent use with lithium may produce additive hypothyroid effects

Cardiovascular ConsiderationsHypokalemia is highly arrhythmogenic, particularly in the setting of ischemia or digitalis toxicity. ECG evidence of hypokalemia includes flattening of the T wave. As the T wave shrinks, U waves may appear. There is no prolongation of the QT interval. Hyperkalemia may present as tall peaked symmetrical T waves. S-T elevation may present in severe hyperkalemia. QRS complex progressively widens with eventual apparent sine waves on the ECG. Hyperkalemia will also induce cardiac slowing and AV conduction abnormalities.

Potassium P-Aminobenzoate

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(poe TASS ee um pe a mee noe BEN zoe ate)
U.S. Brand NamesPotaba®
Pharmacologic CategoryVitamin, Water Soluble
Use: Labeled IndicationsPresently, all indications are classified by the FDA as “possibly effective.”

Treatment of scleroderma, dermatomyositis, morphea, linear scleroderma, pemphigus, Peyronie's disease

Dosing: AdultsOral: Average dose: 12 g/day in 4-6 divided doses
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricOral: 1 g/10 pounds of weight/day; administer in divided doses
Administration: OralAll forms should be administered after meals or with a snack.

Capsule: Take with a glass of water.

Powder: Mix in glass of chilled water or juice; stir and drink.

Tablet: Crush and add to glass of chilled water or juice; stir and drink.

Dietary ConsiderationsTake with food to avoid stomach upset.
ContraindicationsHypersensitivity to potassium p-aminobenzoate or any component of the formulation; concurrent use of sulfonamides
Warnings/Precautions

Concerns related to adverse effects:

- Anorexia: Interrupt therapy if anorexia occurs; may reinstitute once patient improves.

- Nausea: Interrupt therapy if nausea occurs; may reinstitute once patient improves.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus or a history of hypoglycemia.

- Renal impairment: Use with caution in patients with renal impairment.

Pregnancy ConsiderationsSafety for use in pregnancy has not been established.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Central nervous system: Fever

Dermatologic: Rash

Gastrointestinal: Anorexia, nausea

Miscellaneous: Hypersensitivity reaction

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 0.5 g

Potaba®: 0.5 g

Powder, for solution, oral: 2 g/packet (50s)

Potaba®: 2 g/packet (50s)

Tablet:

Potaba®: 0.5 g

Generic AvailableYes: Excludes tablet
Pricing: U.S. (www.drugstore.com)

Capsules (Aminobenzoate Potassium)

500 mg (250): $100.58

Capsules (Potaba)

500 mg (60): $41.99

Pack (Potaba)

2 g (50): $115.26

Tablets (Potaba)

500 mg (60): $43.42

Mechanism of ActionP-aminobenzoate is a member of the vitamin B complex family. It may have an antifibrotic effect due to increased oxygen uptake at the tissue level.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Potassium Perchlorate

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(poe TASS ee um per KLOR ate)
U.S. Brand NamesPerchloracap® [DSC]
Pharmacologic CategoryDiagnostic Agent
Use: Labeled IndicationsMinimizes accumulation of pertechnetate Tc 99m in imaging studies
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Avoid high humidity.
Pregnancy Risk FactorC
Pregnancy ConsiderationsPotassium perchlorate was shown to cause fetal goiter in animal studies. Elective examinations in women of childbearing potential are suggested during the first 10 days following onset of menses.
LactationExcretion in breast milk unknown/use caution
Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Medication Safety Issues

Sound-alike/look-alike issues:

K-Phos® Neutral may be confused with Neutra-Phos-K®

Pronunciation(poe TASS ee um FOS fate & SOW dee um FOS fate)
U.S. Brand NamesK-Phos® MF; K-Phos® Neutral; K-Phos® No. 2; Neutra-Phos® [OTC] [DSC]; Phos-NaK; Phospha 250™ Neutral; Uro-KP-Neutral®
Pharmacologic CategoryElectrolyte Supplement, Oral
Use: Labeled IndicationsTreatment of conditions associated with excessive renal phosphate loss or inadequate GI absorption of phosphate; to acidify the urine to lower calcium concentrations; to increase the antibacterial activity of methenamine; reduce odor and rash caused by ammonia in urine
Dosing: Adults**Phosphate supplement:** Oral: Elemental phosphorus 250-500 mg 4 times/day after meals and at bedtime
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Phosphate supplement:** Oral: Children ≥4 years: Elemental phosphorus 250 mg 4 times/day after meals and at bedtime
Administration: OralAdminister with food to reduce risk of diarrhea.

Caplet, tablet: Should be taken with a full glass of water.

Powder: Phos-NaK: Contents of 1 packet should be diluted in 75 mL water before administration. Following dilution of powder, solution may be chilled to increase palatability.

Dietary ConsiderationsShould be taken after meals. In addition to phosphate, products contain potassium and sodium.
ContraindicationsAddison's disease, hyperkalemia, hyperphosphatemia, infected urolithiasis or struvite stone formation, patients with severely impaired renal function
Warnings/Precautions

Disease-related concerns:

- Cardiac disease: Use with caution in patients with cardiac disease, including hypotension.
- Dehydration: Use with caution in patients with acute dehydration.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hypernatremia: Use with caution in patients with hypernatremia.
- Metabolic alkalosis: Use with caution in patients with metabolic alkalosis.
- Renal impairment: Use with caution in patients with renal impairment.

Geriatric ConsiderationsA complete drug history should be taken to rule out potential drug interactions since elderly frequently may be taking potassium and potassium-sparing diuretics or salicylates as antacids. Elderly may require less potassium than younger adults due to decreased renal function. Elderly who do not respond to replacement therapy, check serum magnesium. Long-term use of diuretics may result in hypomagnesemia.
Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, arrhythmia, chest pain, edema, tachycardia

Central nervous system: Mental confusion, tetany (with large doses of phosphate), headache, dizziness, seizure

Endocrine & metabolic: Hyperkalemia, alkalosis

Gastrointestinal: Diarrhea, nausea, stomach pain, flatulence, vomiting, throat pain, weight gain

Genitourinary: Urine output decreased

Local: Phlebitis

Neuromuscular & skeletal: Weakness, arthralgia, bone pain, paralysis, paresthesia, pain/weakness of extremities, muscle cramps

Renal: Acute renal failure

Respiratory: Dyspnea

Miscellaneous: Thirst

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: May enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Monitoring ParametersSerum potassium, sodium, calcium, phosphate, ECG

Nursing: Physical Assessment/MonitoringSee individual agent for Potassium Phosphate.

Monitoring: Lab TestsSerum potassium, phosphate

Patient EducationSee individual agent for Potassium Phosphate.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet:

Uro-KP-Neutral®: Dipotassium phosphate, disodium phosphate, and monobasic sodium phosphate [equivalent to elemental phosphorus 258 mg, sodium 262.4 mg (10.8 mEq), and potassium 49.4 mg (1.3 mEq)]

Powder, for oral solution:

Neutra-Phos®: Dibasic potassium phosphate, monobasic potassium phosphate, dibasic sodium phosphate, and monosodium phosphate per packet (100s) [equivalent to elemental phosphorus 250 mg (14.25 mEq), sodium 164 mg (7.1 mEq), and potassium 278 mg (7.1 mEq) per packet] [DSC]

Phos-NaK: Dibasic potassium phosphate, monobasic potassium phosphate, dibasic sodium phosphate, and monosodium phosphate per packet (100s) [sugar free; equivalent to elemental phosphorus 250 mg, sodium 160 mg (6.9 mEq), and potassium 280 mg (7.1 mEq) per packet; fruit flavor]

Tablet:

K-Phos® MF: Potassium acid phosphate 155 mg and sodium acid phosphate 350 mg [equivalent to elemental phosphorus 125.6 mg, sodium 67 mg (2.9 mEq), and potassium 44.5 mg (1.1 mEq)]

K-Phos® Neutral: Monobasic potassium phosphate 155 mg, dibasic sodium phosphate 852 mg, and monobasic sodium phosphate 130 mg [equivalent to elemental phosphorus 250 mg, sodium 298 mg (13 mEq), and potassium 45 mg (1.1 mEq)]

K-Phos® No. 2: Potassium acid phosphate 305 mg and sodium acid phosphate 700 mg [equivalent to elemental phosphorus 250 mg, sodium 134 mg (5.8 mEq), and potassium 88 mg (2.3 mEq)]

Phospha 250™ Neutral: Monobasic potassium phosphate 155 mg, dibasic sodium phosphate 852 mg, and monobasic sodium phosphate 130 mg [equivalent to elemental phosphorus 250 mg, sodium 298 mg (13 mEq), and potassium 45 mg (1.1 mEq)]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Pack (Neutra-Phos)

278-164-250 mg (100): $59.99

Pack (Phos-NaK)

278-164-250 mg (100): $35.99

Tablets (K-Phos No 2)

305-700 mg (30): $8.99

Tablets (K-Phos-Neutral)

155-852-130 mg (30): $16.99

Pharmacodynamics/KineticsExcretion: Urine

Pharmacotherapy PearlsAdditional terminology for the potassium and sodium salts:

Sodium phosphate monobasic = Sodium acid phosphate

Sodium phosphate dibasic = Disodium phosphate

Potassium phosphate monobasic = Potassium acid phosphate

Potassium phosphate dibasic = Dipotassium phosphate

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsHypokalemia is highly arrhythmogenic, particularly in the setting of ischemia or digitalis toxicity. ECG evidence of hypokalemia includes flattening of the T wave. As the T wave shrinks, U waves may appear. There is no prolongation of the QT interval. Hyperkalemia may present as tall peaked symmetrical T waves. S-T elevation may present in severe hyperkalemia. QRS complex progressively widens with eventual apparent sine waves on the ECG. Hyperkalemia will also induce cardiac slowing and AV conduction abnormalities.

Index TermsSodium Phosphate and Potassium Phosphate

Potassium Phosphate

Medication Safety Issues

Sound-alike/look-alike issues:

Neutra-Phos®-K may be confused with K-Phos Neutral®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Per JCAHO recommendations, concentrated electrolyte solutions should not be available in patient care areas.

Consider special storage requirements for intravenous potassium salts; I.V. potassium salts have been administered IVP in error, leading to fatal outcomes.

Safe Prescribing: Because inorganic phosphate exists as monobasic and dibasic anions, with the mixture of valences dependent on pH, ordering by mEq amounts is unreliable and may lead to large dosing errors. In addition, I.V. phosphate is available in the sodium and potassium salt; therefore, the content of these cations must be considered when ordering phosphate. The most reliable method of ordering I.V. phosphate is by millimoles, then specifying the potassium or sodium salt. For example, an order for 15 mmol of phosphate as potassium phosphate in one liter of normal saline. The dosing of phosphate should be 0.2-0.3 mmol/kg with a usual daily requirement of 30-60 mmol/day or 15 mmol of phosphate per liter of TPN or 15 mmol phosphate per 1000 calories of dextrose. Would also provide 22 mEq of potassium.

Pronunciation(poe TASS ee um FOS fate)

U.S. Brand NamesNeutra-Phos®-K [OTC] [DSC]

Pharmacologic CategoryElectrolyte Supplement, Oral; Electrolyte Supplement, Parenteral

Use: Labeled IndicationsTreatment and prevention of hypophosphatemia; **Note:** The concomitant amount of potassium must be calculated into the total electrolyte content. For each 1 mmol of phosphate, ~1.5 mEq of potassium will be administered. Therefore, if ordering 30 mmol of potassium phosphate, the patient will receive ~45 mEq of potassium.

Dosing: Adults

Normal requirements elemental phosphorus: Oral:

Pregnancy lactation: Additional 400 mg/day

Adults: 800 mg

I.V.: **Caution: The concomitant amount of potassium must be calculated into the total electrolyte content. For each 1 mmol of phosphate, ~1.5 mEq of potassium will be administered. Therefore, if ordering 30 mmol of potassium phosphate, the patient will receive ~45 mEq of potassium. With orders for I.V. phosphate, there is considerable confusion associated with the use of millimoles (mmol) versus milliequivalents (mEq) to express the phosphate requirement.** The most reliable method of ordering I.V. phosphate is by millimoles, then specifying the potassium or sodium salt (see Medication Safety Issues). Doses listed as mmol of phosphate.

Acute treatment of hypophosphatemia: It is recommended that repletion of severe hypophosphatemia be done I.V. because large doses of oral phosphate may cause diarrhea and intestinal absorption may be unreliable. Intermittent I.V. infusion should be reserved for severe depletion situations; requires continuous cardiac monitoring. Guidelines differ based on degree of illness, need/use of TPN, and severity of hypophosphatemia. If potassium >4.0 mEq/L consider phosphate replacement strategy without potassium (eg, sodium phosphates). Obese patients and/or severe renal impairment were excluded from phosphate supplement trials.

General replacement guidelines (Lentz, 1978):

Low dose: 0.08 mmol/kg over 6 hours; use if losses are recent and uncomplicated

Intermediate dose: 0.16-0.24 mmol/kg over 4-6 hours; use if serum phosphorus level 0.5-1 mg/dL (0.16-0.32 mmoles/L)

Note: The initial dose may be increased by 25% to 50% if the patient is symptomatic secondary to hypophosphatemia and lowered by 25% to 50% if the patient is hypercalcemic.

Patients receiving TPN; supplemental dose (Clark, 1995):

Low dose: 0.16 mmol/kg over 4-6 hours; use if serum phosphorus level 2.3-3 mg/dL (0.73-0.96 mmoles/L)

Intermediate dose: 0.32 mmol/kg over 4-6 hours; use if serum phosphorus level 1.6-2.2 mg/dL (0.51-0.72 mmoles/L)

High dose: 0.64 mmol/kg over 8-12 hours; use if serum phosphorus <1.5 mg/dL (<0.5 mmoles/L)

Critically-ill adult trauma patients receiving TPN (Brown, 2006):

Low dose: 0.32 mmol/kg over 4-6 hours; use if serum phosphorus level 2.3-3 mg/dL (0.73-0.96 mmoles/L)

Intermediate dose: 0.64 mmol/kg over 4-6 hours; use if serum phosphorus level 1.6-2.2 mg/dL (0.51-0.72 mmoles/L)

High dose: 1 mmol/kg over 8-12 hours; use if serum phosphorus <1.5 mg/dL (<0.5 mmoles/L)

Maintenance:

I.V. solutions: 15-30 mmol/24 hours I.V. or 50-150 mmol/24 hours orally in divided doses

Oral: 1-2 capsules (250-500 mg phosphorus/8-16 mmol) 4 times/day; dilute as instructed

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricI.V. doses should be incorporated into the patient's maintenance I.V. fluids. Intermittent I.V. infusion should be reserved for severe depletion situations; requires continuous cardiac monitoring. It is difficult to determine total body phosphorus deficit; the following are empiric guidelines.

Note: Refer to notes under adult dosing

Normal requirements elemental phosphorus: Oral:

0-6 months: 240 mg

6-12 months: 360 mg

1-10 years: 800 mg

>10 years: 1200 mg

Pediatric I.V. phosphate repletion: Children: 0.25-0.5 mmol/kg **administer over 4-6 hours and repeat if symptomatic hypophosphatemia persists**; to assess the need for further phosphate administration, obtain serum inorganic phosphate after administration of the first dose and base further doses on serum levels and clinical status

Maintenance:

I.V. solutions: Children: 0.5-1.5 mmol/kg/24 hours I.V. or 2-3 mmol/kg/24 hours orally in divided doses

Oral:

Children <4 years: 1 capsule (250 mg phosphorus/8 mmol) 4 times/day; dilute as instructed

Children >4 years: Refer to adult dosing.

StorageStore at room temperature; do not freeze. Use only clear solutions. Up to 10-15 mEq of calcium may be added per liter before precipitate may occur.

Stability of parenteral admixture at room temperature (25°C) is 24 hours.

Phosphate salts may precipitate when mixed with calcium salts. Solubility is improved in amino acid parenteral nutrition solutions. Check with a pharmacist to determine compatibility.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_{10}LR, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, D_{10}W, $^1/_2$NS, NS; **incompatible** with D_5LR, D_{10}NS, LR; **variable stability (consult detailed reference)** in TPN.

Y-site administration: Compatible: Ciprofloxacin, diltiazem, enalaprilat, esmolol, famotidine, labetalol. **Incompatible:** Gatifloxacin. **Variable (consult detailed reference):** TPN.

Compatibility when admixed: Compatible: Magnesium sulfate, metoclopramide, verapamil. **Incompatible:** Dobutamine. **Variable (consult detailed reference):** Calcium chloride, calcium gluconate, ciprofloxacin.

ContraindicationsHyperphosphatemia, hyperkalemia, hypocalcemia, hypomagnesemia, renal failure

Warnings/Precautions

Concerns related to adverse effects:

- Hyperkalemia: Close monitoring of serum potassium concentrations is needed to avoid hyperkalemia; severe hyperkalemia may lead to muscle weakness/paralysis and cardiac conduction abnormalities (eg, heart block, ventricular arrhythmias, asystole).

Disease-related concerns:

- Acid/base disorders: Use with caution in patients with acid/base alterations; changes in serum potassium concentrations can occur during acid/base correction, monitor closely.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (eg, heart failure, cardiac arrhythmias); patients may be more susceptible to life-threatening cardiac effects associated with hyper/hypokalemia.

- Renal impairment: Use with caution in patients with renal impairment; renal impairment requires close monitoring of serum potassium and phosphorus concentrations to avoid hyperkalemia and/or hyperphosphatemia.

Concurrent drug therapy issues:

- Digitalis: Use with caution in digitalized patients; may be more susceptible to potentially life-threatening cardiac effects with rapid changes in serum potassium concentrations.

- Potassium-altering therapies: Use with caution in patients receiving concomitant medications or therapies that increase potassium (eg, ACEI, potassium-sparing diuretics, potassium containing salt substitutes).

Dosage form specific issues:

- Oral formulations: May cause GI upset (eg, nausea, vomiting, diarrhea, abdominal pain, discomfort) and lead to GI ulceration, bleeding, perforation and/or obstruction. Oral liquid preparations (not solid) should be used in patients with esophageal compression or delayed gastric emptying.

Other warnings/precautions:

- Calcium/phosphate compatibility: Admixture of phosphate and calcium in I.V. fluids can result in calcium phosphate precipitation.

- Parenteral administration: Use extreme caution when administering potassium phosphate parenterally; evaluate patient's renal function, cardiac and fluid status, and any factors contributing to altered potassium concentrations (eg, acidosis, alkalosis) prior to therapy. Closely monitor potassium and phosphate concentrations and response to therapy. Parenteral potassium may cause pain and phlebitis, requiring a decrease in infusion rate or potassium concentration.

Geriatric ConsiderationsA complete drug history should be taken to rule out potential drug interactions since elderly frequently may be taking potassium and potassium-sparing diuretics or salicylates as antacids. Elderly may require less potassium than younger adults due to decreased renal function. Elderly who do not respond to replacement therapy, check serum magnesium. Long-term use of diuretics may result in hypomagnesemia. Monitor closely in elderly with Cl_{cr} <30 mL/minute.
Pregnancy Risk FactorC
Adverse Reactions

>10%: Gastrointestinal: Diarrhea, nausea, stomach pain, flatulence, vomiting

1% to 10%:

Cardiovascular: Bradycardia

Endocrine & metabolic: Hyperkalemia

Neuromuscular & skeletal: Weakness

Respiratory: Dyspnea

<1%: Abdominal pain, acute renal failure, alkalosis, chest pain, hypocalcemia tetany (with large doses of phosphate), mental confusion, paralysis, paresthesia, phlebitis, throat pain

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: May enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Avoid administering with oxalate (berries, nuts, chocolate, beans, celery, tomato) or phytate-containing foods (bran, whole wheat).
Test InteractionsDecreased ammonia (B)
Monitoring ParametersSerum potassium, calcium, phosphate, sodium, cardiac monitor (when intermittent infusion or high-dose I.V. replacement needed)
Nursing: Physical Assessment/MonitoringAssess therapeutic response and adverse effects.
Monitoring: Lab TestsSerum potassium, phosphate
Patient EducationEmpty contents of packet into 3-4 oz of water. Take with food to reduce the risk of diarrhea. Report excessive nausea, stomach pain, or vomiting. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution: Potassium 4.4 mEq and phosphorus 3 mmol per mL (5 mL, 15 mL, 50 mL) [equivalent to potassium 170 mg and elemental phosphorus 93 mg per mL]

Powder for oral solution:

Neutra-Phos®-K: Monobasic potassium phosphate and dibasic potassium phosphate per packet (100s) [equivalent to elemental potassium 556 mg (14.25 mEq) and phosphorus 250 mg (14.25 mEq) per packet; sodium and sugar free; fruit flavor] [DSC]

Medication Safety Issues

Sound-alike/look-alike issues:

Betadine® may be confused with Betagan®, betaine

International issues:

Alphadine®: Brand name for ranitidine in Greece

Oralon® [Japan] may be confused with Oralone® which is a brand name for triamcinolone in the U.S.

Pronunciation(POE vi done EYE oh dyne)

U.S. Brand NamesBetadine®; Operand® [OTC]; Povidine™ [OTC]; Summer's Eve® Medicated Douche [OTC]; Vagi-Gard® [OTC]

Canadian Brand NamesBetadine®; Proviodine

Pharmacologic CategoryAntiseptic, Ophthalmic; Antiseptic, Topical; Antiseptic, Vaginal; Topical Skin Product

Use: Labeled IndicationsExternal antiseptic with broad microbicidal spectrum for the prevention or treatment of topical infections associated with surgery, burns, minor cuts/scrapes; relief of minor vaginal irritation

Dosing: Adults

Antiseptic: Topical: Apply to affected area as needed. Ophthalmic solution may be used to irrigate the eye or applied to area around the eye such as skin, eyelashes, or lid margins.

Surgical scrub: Topical: Apply solution to wet skin or hands, scrub for ~5 minutes, rinse; refer to product labeling for specific procedure-related instructions.

Vaginal irritation: Douche: Insert 0.3% solution vaginally once daily for 5-7 days

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to iodine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Toxicity: May occur following application of large or prolonged quantities.

Disease-related concerns:

- Burns: Use with caution in patients with burns.
- Renal impairment: Use with caution in patients with renal impairment.
- Thyroid dysfunction: Use with caution in patients with thyroid disorders.

Special populations:

- Pediatrics: Use with caution in children.

Other warnings/precautions:

- Self-medication (OTC use): When used for self-medication (OTC use) do not apply to deep puncture wounds or serious burns; discontinue in case of redness, swelling, irritation or pain; do not use for longer than 1 week.

Pregnancy Risk FactorC (ophthalmic)

Pregnancy ConsiderationsReproduction studies have not been conducted. Vaginal products should not be used during pregnancy. Absorbed systemically as iodine. Transient hypothyroidism in the newborn has been reported following topical or vaginal use prior to delivery. Refer to Iodine for additional information.

LactationEnters breast milk/use caution (AAP rates "compatible")

Breast-Feeding ConsiderationsRefer to Iodine monograph.

Adverse ReactionsFrequency not defined. Also refer to Iodine.

Local: Edema, irritation, pruritus, rash

Drug InteractionsThere are no known significant interactions.

Betadine®: 5% (90 mL) [CFC free; contains dry natural rubber]

Operand®: 10% (59 mL)

Solution, topical [surgical scrub sponge]: 10% (50s)

Solution, vaginal [concentrate, douche]:

Operand®: 10% (240 mL)

Vagi-Gard®: 10% (180 mL, 240 mL)

Solution, vaginal [douche]:

Summer's Eve® Medicated Douche: 0.3% (135 mL) [contains sodium benzoate]

Solution [concentrate, whirlpool]:

Operand®: 10% (3840 mL)

Swabsticks: 10% (25s, 50s, 1000s)

Betadine®: 10% (50s, 200s)

Swabsticks [gel saturated]: 10% (50s)

Swabsticks, topical [surgical scrub]: 7.5% (25s, 50s, 1000s)

Generic AvailableYes

Mechanism of ActionPovidone-iodine is known to be a powerful broad spectrum germicidal agent effective against a wide range of bacteria, viruses, fungi, protozoa, and spores.

Pharmacodynamics/KineticsAbsorption: Topical: Absorbed systemically as iodine; amount depends upon concentration, route of administration, characteristics of skin

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index Terms Polyvinylpyrrolidone with Iodine; PVP-I

Pralidoxime

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Pralidoxime may be confused with pramoxine, pyridoxine

Protopam® may be confused with Proloprim®, protamine, Protropin®

Pronunciation(pra li DOKS eem)

U.S. Brand NamesProtopam®

Canadian Brand NamesProtopam®

Pharmacologic CategoryAntidote

Use: Labeled IndicationsReverse muscle paralysis caused by toxic exposure to organophosphate anticholinesterase pesticides and chemicals; control of overdose of anticholinesterase medications used to treat myasthenia gravis (ambenonium, neostigmine, pyridostigmine)

Use: Unlabeled/InvestigationalTreatment of nerve agent toxicity (chemical warfare) in combination with atropine

Dosing: Adults

Organic phosphorus poisoning (use in conjunction with atropine; atropine effects should be established before pralidoxime is administered): I.V. (may be given I.M. or SubQ if I.V. is not feasible): Initial: 30 mg/kg over 20 minutes, maintenance: I.V. infusion: 4-8 mg/kg/hour

Treatment of acetylcholinesterase inhibitor toxicity: I.V.: Initial: 1-2 g followed by increments of 250 mg every 5 minutes until response is observed

Nerve agent toxicity management (unlabeled use):

Note: Atropine is a component of the management of nerve agent toxicity; consult atropine monograph for specific route and dose. To be effective, pralidoxime must be administered within minutes to a few hours following exposure (depending on the nerve agent).

Prehospital ("in the field"): Mild-to-moderate symptoms: I.M.: 600 mg; severe symptoms: 1800 mg

Hospital/emergency department: Mild-to-severe symptoms: I.V.: 15 mg/kg (up to 1 g)

Dosing: ElderlyRefer to adult dosing. Dosing should be cautious, considering possibility of decreased hepatic, renal, or cardiac function.

Nerve agent toxicity management (unlabeled use): To be effective, pralidoxime must be administered within minutes to a few hours following exposure (depending on the nerve agent). Also see **"Note"** in adult dosing.

Frail patients, elderly:

Prehospital ("in the field"): Mild-to-moderate symptoms: I.M.: 10 mg/kg; severe symptoms: 25 mg/kg

Hospital/emergency department: Mild-to-severe symptoms: I.V.: 5-10 mg/kg

Dosing: Pediatric

Organic phosphorus poisoning: I.V. (may be given I.M. or SubQ if I.V. is not feasible): 20-50 mg/kg/dose; repeat in 1-2 hours if muscle weakness has not been relieved, then at 8- to 12-hour intervals if cholinergic signs recur

Note: Use in conjunction with atropine; atropine effects should be established before pralidoxime is administered

Nerve agent toxicity management (unlabeled use): To be effective, pralidoxime must be administered within minutes to a few hours following exposure (depending on the nerve agent). Also see **"Note"** in adult dosing.

Infants and Children:

Prehospital ("in the field"): Mild-to-moderate symptoms: I.M.: 15 mg/kg; severe symptoms: 25 mg/kg

Hospital/emergency department: Mild-to-severe symptoms: I.V.: 15 mg/kg (up to 1 g)

Dosing: Renal ImpairmentDose should be reduced.

Administration: I.V.I.V.: Infuse over 15-30 minutes at a rate not to exceed 200 mg/minute; may administer I.M. or SubQ if I.V. is not accessible. If a more concentrated 5% solution is used, infuse over at least 5 minutes.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ReconstitutionFor I.V. administration, dilute 1 g with 20 mL SWI. Solution should be further diluted and administered as 1-2 g in 100 mL NS. If not practical or in cases of fluid overload, may prepare as a 5% solution.

ContraindicationsHypersensitivity to pralidoxime or any component of the formulation; poisonings due to phosphorus, inorganic phosphates, or organic phosphates without anticholinesterase activity; poisonings due to pesticides of carbamate class (may increase toxicity of carbaryl)

Warnings/Precautions

Disease-related concerns:

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Renal impairment: Use with caution in patients with renal impairment; dosage modification required.

Other warnings/precautions:

- Appropriate use: Clinical symptoms consistent with highly-suspected organophosphorous poisoning should be treated with antidote immediately; administration should not be delayed for confirmatory laboratory tests. Treatment should always include proper evacuation and decontamination procedures; medical personnel should protect themselves from inadvertent contamination. Antidotal administration is intended only for initial management; definitive and more extensive medical care is required following administration. Individuals should not rely solely on antidote for treatment, as other supportive measures (eg, artificial respiration) may still be required.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, tachycardia

Central nervous system: Dizziness, drowsiness, headache

Dermatologic: Rash

Gastrointestinal: Nausea

Hepatic: ALT increased (transient), AST increased (transient)

Local: Pain at injection site after I.M. administration

Neuromuscular & skeletal: Muscle rigidity, weakness

Ocular: Accommodation impaired, blurred vision, diplopia

Renal: Renal function decreased

Respiratory: Hyperventilation, laryngospasm

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersHeart rate, respiratory rate, blood pressure, continuous ECG; cardiac monitor and blood pressure monitor required for I.V. administration

Reference RangeMinimum therapeutic concentration: 4 mcg/mL

Nursing: Physical Assessment/MonitoringMonitor vital signs, blood pressure, and respiratory status on a frequent basis. Continuous ECG and hemodynamic monitoring. Monitor fluid balance throughout therapy (oliguria). With organophosphate poisoning or anticholinesterase overdose, monitor closely for muscle weakness or twitching, reduction in respiratory function, or altered consciousness. Keep under observation for 48-72 hours.

Patient EducationWhen administered in emergency situation, patient education and instruction should be appropriate to patient condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as chloride:

Protopam®: 1 g

Injection, solution: 300 mg/mL (2 mL) [contains benzyl alcohol; prefilled auto injector]

Generic AvailableNo

ManufacturerWyeth

Mechanism of ActionReactivates cholinesterase that had been inactivated by phosphorylation due to exposure to organophosphate pesticides by displacing the enzyme from its receptor sites; removes the phosphoryl group from the active site of the inactivated enzyme

Pharmacodynamics/Kinetics

Protein binding: None

Metabolism: Hepatic

Half-life elimination: 74-77 minutes

Time to peak, serum: I.V.: 5-15 minutes

Excretion: Urine (80% to 90% as metabolites and unchanged drug)

Pharmacotherapy PearlsPralidoxime is most effective when given immediately after poisoning. If the poison has been ingested, exposure may continue due to slow absorption from the lower bowel; relapses may occur after initial improvement and treatment may need continued for several days in these patients. In cases of dermal exposure to organophosphate poisoning, clothing should be removed and hair and skin washed with sodium bicarbonate or alcohol as soon as possible.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentAvoid with phenothiazines; effects of barbiturates may be increased

Cardiovascular ConsiderationsUse I.V. phentolamine for treatment of pralidoxime-induced hypertension (children: 1 mg; adults: 5 mg).

Anesthesia and Critical Care Concerns/Other ConsiderationsUse I.V. phentolamine for treatment of pralidoxime-induced hypertension (children: 1 mg; adults: 5 mg).

Index Terms2-PAM; 2-Pyridine Aldoxime Methochloride; Pralidoxime Chloride

Pramipexole

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Mirapex® may be confused with Mifeprex®, MiraLax™

Pronunciation(pra mi PEKS ole)
U.S. Brand NamesMirapex®
Canadian Brand NamesApo-Pramipexole; Mirapex®; Novo-Pramipexole; PMS-Pramipexole; SANDOZ-Pramipexole
Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist
Use: Labeled IndicationsTreatment of the signs and symptoms of idiopathic Parkinson's disease; treatment of moderate-to-severe primary Restless Legs Syndrome (RLS)
Use: Unlabeled/InvestigationalTreatment of depression
Dosing: Adults

Parkinson's disease: Oral: Initial: 0.375 mg/day given in 3 divided doses; increase gradually by 0.125 mg/dose every 5-7 days; range: 1.5-4.5 mg/day.

Restless legs syndrome: Oral: Initial: 0.125 mg once daily 2-3 hours before bedtime. Dose may be doubled every 4-7 days up to 0.5 mg/day. Maximum dose: 0.5 mg/day (manufacturer's recommendation).

Note: Most patients require <0.5 mg/day, but higher doses have been used (2 mg/day). If augmentation occurs, dose earlier in the day.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentUse caution; renally-eliminated

Parkinson's disease:

Cl_{cr} 35-59 mL/minute: Initial: 0.125 mg twice daily (maximum dose: 1.5 mg twice daily)

Cl_{cr} 15-34 mL/minute: Initial: 0.125 mg once daily (maximum dose: 1.5 mg once daily)

Cl_{cr} <15 mL/minute (or hemodialysis patients): Not adequately studied.

Restless legs syndrome:

Cl_{cr} 20-60 mL/minute: Duration between titration should be increased to 14 days

Cl_{cr} <20 mL/minute: Not adequately studied

Calculations

- Creatinine Clearance: Adults

Administration: OralDoses should be titrated gradually in all patients to avoid the onset of intolerable side effects. The dosage should be increased to achieve a maximum therapeutic effect, balanced against the side effects of dyskinesia, hallucinations, somnolence, and dry mouth.
Dietary ConsiderationsMay be taken with food to decrease nausea.
StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.
ContraindicationsHypersensitivity to pramipexole or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Hallucinations: May cause hallucinations, particularly in older patients.

- Impulsive control disorders: Dopamine agonists used for Parkinson's disease or restless legs syndrome have been associated with compulsive behaviors and/or loss of impulse control, which has manifested as pathological gambling, libido increases (hypersexuality), and/or binge eating. Causality has not been established, and controversy exists as to whether this phenomenon is related to the underlying disease, prior behaviors/addictions and/or drug therapy. Dose reduction or discontinuation of therapy has been reported to reverse these behaviors in some, but not all cases.

- Orthostatic hypotension: May cause orthostatic hypotension; Parkinson's disease patients appear to have an impaired capacity to respond to a postural challenge. Use with caution in patients at risk of hypotension (such as those receiving antihypertensive drugs) or where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease). Parkinson's patients being treated with dopaminergic agonists ordinarily require careful monitoring for signs and symptoms of postural hypotension, especially during dose escalation, and should be informed of this risk.

- Pleural/retroperitoneal fibrosis: Ergot-derived dopamine agonists have also been associated with fibrotic complications (eg, retroperitoneal fibrosis, pleural thickening, and pulmonary infiltrates). Although pramipexole is not an ergot, there have been postmarketing reports of possible fibrotic complications with pramipexole; monitor closely for signs and symptoms of fibrosis.

- Retinal changes: Pathologic degenerative changes were observed in the retinas of albino rats during studies with this agent, but were not observed in the retinas of albino mice or in other species. The significance of these data for humans remains uncertain.

- Somnolence: Patients have reported falling asleep while engaging in activities of daily living; this has been reported to occur without significant warning signs. Monitor for daytime somnolence or pre-existing sleep disorder; caution with concomitant sedating medication; discontinue if significant daytime sleepiness or episodes of falling asleep occur. Patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). Use with caution in patients receiving other CNS depressants or psychoactive agents. Effects with other sedative drugs or ethanol may be potentiated. Pramipexole has been associated with somnolence, particularly at higher dosages (>1.5 mg/day).

Disease-related concerns:

- Dyskinesias: Use with caution in patients with pre-existing dyskinesias; may be exacerbated.

- Renal impairment: Use with caution in patients with renal impairment; dose adjustment necessary.

- Restless legs syndrome (RLS): Augmentation (earlier onset of symptoms in the evening/afternoon, increase and/or spread of symptoms to other extremities) or rebound (shifting of symptoms to early morning hours) may occur in some RLS patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Discontinuation of therapy: Dopaminergic agents have been associated with a syndrome resembling neuroleptic malignant syndrome on abrupt withdrawal or significant dosage reduction after long-term use.

Pregnancy Risk FactorC
Pregnancy ConsiderationsEarly embryonic loss and postnatal growth inhibition were observed in animal studies. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsProlactin secretion may be inhibited.
Adverse Reactions Parkinson’s disease (PD) unless identified as RLS:

>10%:

Cardiovascular: Postural hypotension (dose related; PD 53%)

Central nervous system: Dizziness (PD 25%), headache (RLS 16%), somnolence (dose related; RLS 6%; PD 9% to 22%), insomnia (RLS 13%; PD 17% to 27%), hallucinations (PD 9% to 17%), abnormal dreams (RLS up to 8%)

Gastrointestinal: Nausea (dose related; RLS: 5% to 27%; PD 28%), constipation (dose related; RLS: 4%; PD 10% to 14%)

Neuromuscular & skeletal: Weakness (PD 10% to 14%), dyskinesia (PD 47%), EPS

1% to 10%:

Cardiovascular: Edema, syncope, tachycardia, chest pain

Central nervous system: Malaise, confusion (PD 4% to 10%), amnesia (dose related), dystonias, akathisia, thinking abnormalities, myoclonus, hyperesthesia, paranoia, fever

Endocrine & metabolic: Decreased libido

Gastrointestinal: Anorexia, diarrhea (RLS 3% to7%), dysphagia, weight loss, xerostomia (up to 7%)

Genitourinary: Urinary frequency (PD 6%), impotence, urinary incontinence

Neuromuscular & skeletal: Muscle twitching, leg cramps, arthritis, bursitis, myasthenia, gait abnormalities, hypertonia

Ocular: Vision abnormalities

Respiratory: Dyspnea, nasal congestion (RLS up to 6%), rhinitis

Miscellaneous: Influenza (RLS 3%)

<1%: Liver transaminases increased

Postmarketing and/or case reports: Augmentation (RLS ~20% but similar to placebo), compulsive gambling, rebound (RLS), rhabdomyolysis, tolerance (RLS)

Reported with dopamine agonists: Impulsive/compulsive behaviors (eg, pathological gambling, hypersexuality, binge eating)

Frequency not defined, dose related: Falling asleep during activities of daily living

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food intake does not affect the extent of drug absorption, although the time to maximal plasma concentration is delayed by 60 minutes when taken with a meal.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersMonitor for improvement in symptoms of Parkinson's disease (eg, mentation, behavior, daily living activities, motor examinations), blood pressure, body weight changes, and heart rate

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor blood pressure. Assess degree of somnolence. Assess for therapeutic effectiveness (improvement of symptoms) and adverse response. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed. Avoid alcohol. May cause drowsiness and extreme sedation or somnolence (use caution when driving or engaging in hazardous activities until response to drug is known); loss of impulse control (possibly manifested as pathological gambling, libido increases, and/or binge eating); postural hypotension (use caution when changing position - rise slowly from sitting or lying position to standing and use caution when climbing stairs); weakness, headache, nausea, abnormal dreams, dry mouth, nausea, hallucinations, or new or increased occurrence of involuntary purposeless movements; constipation (increased exercise, fluids, fruit, or fiber may help); or urinary frequency. Consult prescriber about persistent adverse effects. Report to prescriber hallucinations; suicide ideation; or difficulty performing or controlling voluntary movements. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian product

Tablet, as dihydrochloride monohydrate: 0.25 mg [CAN; generic not available in U.S.], 0.5 mg [CAN; generic not available in U.S.], 1 mg [CAN; generic not available in U.S.], 1.5 mg [CAN; generic not available in U.S.]

Mirapex®: 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg

Generic AvailableNo

ManufacturerPharmacia & Upjohn

Pricing: U.S. (www.drugstore.com)

Tablets (Mirapex)

0.125 mg (30): $92.18

0.25 mg (90): $244.19

0.5 mg (90): $227.10

1 mg (90): $225.74

1.5 mg (90): $238.11

Mechanism of ActionPramipexole is a nonergot dopamine agonist with specificity for the D_2 subfamily dopamine receptor, and has also been shown to bind to D_3 and D_4 receptors. By binding to these receptors, it is thought that pramipexole can stimulate dopamine activity on the nerves of the striatum and substantia nigra.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: V_d: 500 L

Protein binding: 15%

Bioavailability: >90%

Half-life elimination: ~8 hours; Elderly: 12-14 hours

Time to peak, serum: ~2 hours

Excretion: Urine (90% as unchanged drug)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Dosing: The concentration of this product is 600 micrograms (mcg)/mL. Manufacturer recommended dosing ranges from 15 mcg to 120 mcg, which corresponds to injectable volumes of 0.025 mL to 0.2 mL. Patients and healthcare providers should exercise caution when administering this product to avoid inadvertent calculation of the dose based on "units," which could result in a sixfold overdose.

Pronunciation(PRAM lin tide)

U.S. Brand NamesSymlin®

Pharmacologic CategoryAmylinomimetic; Antidiabetic Agent

Use: Labeled Indications

Adjunctive treatment with mealtime insulin in type 1 diabetes mellitus (insulin dependent, IDDM) patients who have failed to achieve desired glucose control despite optimal insulin therapy

Adjunctive treatment with mealtime insulin in type 2 diabetes mellitus (noninsulin dependent, NIDDM) patients who have failed to achieve desired glucose control despite optimal insulin therapy, with or without concurrent sulfonylurea and/or metformin

Dosing: Adults**Note:** When initiating pramlintide, reduce current insulin dose (including rapidly- and mixed-acting preparations) by 50% to avoid hypoglycemia. If pramlintide is discontinued for any reason, restart therapy with same initial titration protocol.

Type 1 diabetes mellitus (insulin dependent, IDDM): SubQ: Initial: 15 mcg immediately prior to meals; titrate in 15 mcg increments every 3 days (if no significant nausea occurs) to target dose of 30-60 mcg (consider discontinuation if intolerant of 30 mcg dose)

Type 2 diabetes mellitus (noninsulin dependent, NIDDM): SubQ: Initial: 60 mcg immediately prior to meals; after 3-7 days, increase to 120 mcg prior to meals if no significant nausea occurs (if nausea occurs at 120 mcg dose, reduce to 60 mcg)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required; not evaluated in dialysis patients

Administration: OtherDo not mix with other insulins; administer subcutaneously into abdominal or thigh areas at sites distinct from concomitant insulin injections (do not administer into arm due to variable absorption); rotate injection sites frequently. Allow solution to reach room temperature before administering; may reduce injection site reactions. For oral medications in which a rapid onset of action is desired, administer 1 hour before, or 2 hours after pramlintide, if possible. When using the pen-injector, do not transfer drug to a syringe; dosing errors could occur.

Dietary ConsiderationsDietary modification based on ADA recommendations is a part of therapy; pramlintide to be administered prior to major meals consisting of ≥250 Kcal or ≥30 g carbohydrates

StorageStore unopened vials at 2°C to 8°C (36°F to 46°F); do not freeze. Opened vials may be kept refrigerated or at room temperature ≤30°C (≤86°F). Discard opened vial after 30 days. Protect from light.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to pramlintide or any component of the formulation; confirmed diagnosis of gastroparesis; hypoglycemia unawareness

Warnings/Precautions

Boxed warnings:

- Insulin/glucose-lowering agents: See “Concurrent drug therapy issues” below.

Disease-related concerns:

- Gastroparesis: Avoid use in patients with conditions or concurrent medications likely to impair gastric motility (eg, anticholinergics); do not use in patients requiring medication(s) to stimulate gastric emptying.

- Nausea: Use with caution in patients with a history of nausea.

- Neuropathic conditions: Use with caution in patients with neuropathic conditions which may mask signs/symptoms of hypoglycemia.

Concurrent drug therapy issues:

- Antihypertensives: Use caution with certain antihypertensive agents (eg, beta-adrenergic blockers) which may mask signs/symptoms of hypoglycemia.

- Insulin/glucose-lowering agents: **[U.S. Boxed Warning]: Coadministration with insulin may induce severe hypoglycemia (usually within 3 hours following administration);** coadministration with insulin therapy is an approved indication, but does require an initial dosage reduction of insulin and frequent pre- and post-blood glucose monitoring to reduce risk of severe hypoglycemia. Concurrent use of other glucose-lowering agents may increase risk of hypoglycemia.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Avoid use in patients with poor compliance with their insulin regimen and/or blood glucose monitoring. Do not use in patients with Hb A_{1c} levels >9% or recent, recurrent episodes of hypoglycemia; obtain detailed history of glucose control (eg, Hb A_{1c}, incidence of hypoglycemia, glucose monitoring, and medication compliance) and body weight before initiating therapy. Use caution in patients with visual or dexterity impairment. Patients should use caution when driving or operating heavy machinery until effects on blood sugar are known.

Geriatric ConsiderationsPatients must be able to adhere to their insulin regimen and self-monitor their blood glucose. In premarketing studies, the change in the Hb A_{1c} values and hypoglycemia frequencies did not differ by age. Monitor regimen closely.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, pramlintide is classified as pregnancy category C. Based on *in vitro* data, pramlintide has a low potential to cross the placenta. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of pramlintide is generally not recommended in the routine management of diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if pramlintide is present in breast milk. The manufacturer recommends that pramlintide be used in nursing women only when the potential benefit to the mother outweighs the possible risk to the infant.

Pregnancy & Lactation, In-Depth

- Pramlintide in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Headache (5% to 13%)

Gastrointestinal: Nausea (28% to 48%), anorexia (≤17%), vomiting (7% to 11%)

Endocrine & metabolic: Severe hypoglycemia (type 1 diabetes ≤17%)

Miscellaneous: Inflicted injury (8% to 14%)

1% to 10%:

Central nervous system: Fatigue (3% to 7%), dizziness (2% to 6%)

Endocrine & metabolic: Severe hypoglycemia (type 2 diabetes ≤8%)

Gastrointestinal: Abdominal pain (2% to 8%)

Respiratory: Cough (2% to 6%), pharyngitis (3% to 5%)

Neuromuscular & skeletal: Arthralgia (2% to 7%)

Miscellaneous: Allergic reaction (≤6%)

Postmarketing and/or case reports: Injection site reactions

Drug Interactions

Anticholinergics: Pramlintide may enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. **Exceptions:** Paliperidone. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Use caution with ethanol (may increase hypoglycemia).

Herb/Nutraceutical: Use caution with garlic, chromium, gymnema (may increase hypoglycemia).

Monitoring ParametersPrior to initiating therapy: Hb A_{1c}, hypoglycemic history, body weight. During therapy: urine sugar and acetone, pre- and postprandial and bedtime serum glucose, electrolytes, Hb A_{1c}, lipid profile

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor laboratory tests, adverse reactions (eg, hypoglycemia), and therapeutic response. Teach patient proper use, including appropriate injection techniques and syringe/needle disposal, and monitoring requirements (or refer to diabetic education), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medications without consulting prescriber. This medication is used to control diabetes; it is not a cure. It is imperative to follow other components of prescribed treatment (eg, diet and exercise regimen). Take exactly as directed. Do not change dose or discontinue unless advised by prescriber. This medication cannot be mixed with insulin. Use a different syringe for each medication. If you experience hypoglycemic reaction, contact prescriber immediately. Always carry quick source of sugar with you. Monitor glucose levels as directed by prescriber. You may experience nausea (small, frequent meals, frequent oral care, sucking lozenges, or chewing gum may help). You may experience headache, fatigue, or dizziness (use caution when driving or engaging in activities requiring alertness until response to drug is known). Report unresolved nausea or vomiting and hypoglycemic reactions. **Pregnancy/breast-feeding precaution:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as acetate:

Symlin®: 600 mcg/mL (5 mL); 1000 mcg/mL (1.5 mL) [60 pen-injector]; 1000 mcg/mL (2.7 mL) [120 pen-injector]

Generic AvailableNo

ManufacturerAmylin Pharmaceutical, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Symlin)

600 mcg/mL (5): $143.35

Solution (SymlinPen 120)

1000 mcg/mL (5.4): $259.20

Mechanism of ActionSynthetic analog of human amylin cosecreted with insulin by pancreatic beta cells; reduces postprandial glucose increases via the following mechanisms: 1) prolongation of gastric emptying time, 2) reduction of postprandial glucagon secretion, and 3) reduction of caloric intake through centrally-mediated appetite suppression

Pharmacodynamics/Kinetics

Duration: 3 hours

Protein binding: ~60%

Metabolism: Primarily renal to des-lys^1 pramlintide (active metabolite)

Bioavailability: ~30% to 40%

Half-life elimination: ~48 minutes

Time to peak, plasma: 20 minutes

Excretion: Primarily urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, lithium, and valproic acid may produce additive effects. Psychotropics with anticholinergic properties may produce synergistic impairment of gastric motility if used with pramlintide.

Index TermsPramlintide Acetate

Medication Safety Issues

Sound-alike/look-alike issues:

Pramosone® may be confused with predniSONE

Zone-A Forte® may be confused with Zonalon®

Pronunciation(pra MOKS een & hye droe KOR ti sone)
U.S. Brand NamesAnalpram-HC®; Epifoam®; Pramosone®; ProctoFoam®-HC
Canadian Brand NamesPramox® HC; Proctofoam™-HC
Pharmacologic CategoryAnesthetic/Corticosteroid
Use: Labeled IndicationsRelief of inflammatory and pruritic manifestations of corticosteroid-responsive dermatoses
Dosing: Adults**Inflammatory conditions:** Topical/rectal: Apply to affected areas 3-4 times/day
Dosing: ElderlyRefer to adult dosing.
Administration: OtherWhen using rectally, the special applicator should be used, the aerosol container should not be placed in the rectum; for local application the foam can be placed on a tissue first.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to pramoxine, hydrocortisone, or any component of the formulation
Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Chronic use of corticosteroids in children may interfere with growth and development.

Pregnancy Risk FactorC
Pregnancy ConsiderationsRefer to Hydrocortisone monograph.
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsHydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Special Alerts

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Statin

Colman E, Szarfman A, Wyeth J, et al, "An Evaluation of a Data Mining Signal for Amyotrophic Lateral Sclerosis and Statins Detected in FDA's Spontaneous Adverse Event Reporting System," *Pharmacoepidemiol Drug Saf*, 2008 (epub ahead of print)

Medication Safety Issues

Sound-alike/look-alike issues:

Pravachol® may be confused with Prevacid®, Prinivil®, propranolol

Pronunciation(prav a STAT in)

U.S. Brand NamesPravachol®

Canadian Brand NamesApo-Pravastatin®; CO Pravastatin; DOM-Pravastatin; GEN-Pravastatin; Novo-Pravastatin; NU-Pravastatin; PHL-Pravastatin; PMS-Pravastatin; Pravachol®; RAN-Pravastatin; ratio-Pravastatin; Riva-Pravastatin; Sandoz-Pravastatin

Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor

Use: Labeled IndicationsUse with dietary therapy for the following:

Primary prevention of coronary events: In hypercholesterolemic patients without established coronary heart disease to reduce cardiovascular morbidity (myocardial infarction, coronary revascularization procedures) and mortality.

Secondary prevention of cardiovascular events in patients with established coronary heart disease: To slow the progression of coronary atherosclerosis; to reduce cardiovascular morbidity (myocardial infarction, coronary vascular procedures) and to reduce mortality; to reduce the risk of stroke and transient ischemic attacks

Hyperlipidemias: Reduce elevations in total cholesterol, LDL-C, apolipoprotein B, and triglycerides (elevations of 1 or more components are present in Fredrickson type IIa, IIb, III, and IV hyperlipidemias)

Heterozygous familial hypercholesterolemia (HeFH): In pediatric patients, 8-18 years of age, with HeFH having LDL-C ≥190 mg/dL **or** LDL ≥160 mg/dL with positive family history of premature cardiovascular disease (CVD) or 2 or more CVD risk factors in the pediatric patient

Dosing: Adults

Hyperlipidemias, primary prevention of coronary events, secondary prevention of cardiovascular events: Oral: Initial: 40 mg once daily; titrate dosage to response (usual range: 10-80 mg) (maximum dose: 80 mg once daily)

Dosage adjustment based on concomitant cyclosporine: Oral: Initial: 10 mg/day, titrate with caution (maximum dose: 20 mg/day)

Note: Doses should be individualized according to the baseline LDL-cholesterol levels, the recommended goal of therapy, and patient response; adjustments should be made at intervals of 4 weeks or more; doses may need adjusted based on concomitant medications

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Heterozygous familial hypercholesterolemia (HeFH): Oral: Children:

8-13 years: 20 mg/day

14-18 years: 40 mg/day

Dosage adjustment based on concomitant cyclosporine: Refer to adult dosing.

Note: Doses should be individualized according to the baseline LDL-cholesterol levels, the recommended goal of therapy, and patient response; adjustments should be made at intervals of 4 weeks or more; doses may need adjusted based on concomitant medications

Dosing: Renal ImpairmentInitial: 10 mg/day
Dosing: Hepatic ImpairmentInitial: 10 mg/day
Administration: OralMay be taken without regard to meals.
Dietary ConsiderationsMay be taken without regard to meals. Before initiation of therapy, patients should be placed on a standard cholesterol-lowering diet for 6 weeks and the diet should be continued during drug therapy. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.
StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture and light.
ContraindicationsHypersensitivity to pravastatin or any component of the formulation; active liver disease; unexplained persistent elevations of serum transaminases; pregnancy; breast-feeding
Allergy Considerations

- HMG-CoA Reductase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease.

Special Populations:

- Elderly: Use with caution in patients with advanced age, these patients are predisposed to myopathy.

- Pediatrics: Treatment is not recommended in patients <8 years of age.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

- Liver function tests: Must be monitored by periodic laboratory assessment.

Geriatric ConsiderationsEffective and well tolerated in the elderly. No specific dosage recommendations. Clearance is reduced in elderly, resulting in an increase in AUC between 25% to 50%. However, substantial accumulation is not expected.

The definition of and, therefore, when to treat hyperlipidemia in elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk FactorX
Pregnancy ConsiderationsCholesterol biosynthesis may be important in fetal development. Contraindicated in pregnancy. Administer to women of childbearing potential only when conception is highly unlikely and patients have been informed of potential hazards.
LactationEnters breast milk/contraindicated
Adverse ReactionsAs reported in short-term trials; safety and tolerability with long-term use were similar to placebo

1% to 10%:

Cardiovascular: Chest pain (4%)

Central nervous system: Headache (2% to 6%), fatigue (4%), dizziness (1% to 3%)

Dermatologic: Rash (4%)

Gastrointestinal: Nausea/vomiting (7%), diarrhea (6%), heartburn (3%)

Hepatic: Transaminases increased (>3x normal on two occasions - 1%)

Neuromuscular & skeletal: Myalgia (2%)

Respiratory: Cough (3%)

Miscellaneous: Influenza (2%)

<1%: Allergy, alopecia, appetite decreased, dermatitis, dry skin, edema, fever, flushing, insomnia, lens opacity, libido change, memory impairment, muscle weakness, neuropathy, paresthesia, pruritus, sexual dysfunction, taste disturbance, tremor, urticaria, vertigo

Postmarketing and/or case reports: Anaphylaxis, angioedema, cholestatic jaundice, cirrhosis, cranial nerve dysfunction, dermatomyositis, erythema multiforme, ESR increase, fulminant hepatic necrosis, gynecomastia, hemolytic anemia, hepatitis, hepatoma, lupus erythematosus-like syndrome, myopathy, pancreatitis, peripheral nerve palsy, polymyalgia rheumatica, positive ANA, purpura, rhabdomyolysis, Stevens-Johnson syndrome, vasculitis

Additional class-related events or case reports (not necessarily reported with pravastatin therapy): Angioedema, cataracts, depression, dyspnea, eosinophilia, erectile dysfunction, facial paresis, hypersensitivity reaction, impaired extraocular muscle movement, impotence, leukopenia, malaise, memory loss, ophthalmoplegia, paresthesia, peripheral neuropathy, photosensitivity, psychic disturbance, skin discoloration, thrombocytopenia, thyroid dysfunction, toxic epidermal necrolysis, transaminases increased, vomiting

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP2C9 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fenofibric Acid: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Consumption of large amounts of ethanol may increase the risk of liver damage with HMG-CoA reductase inhibitors.

Food: Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

Herb/Nutraceutical: St John's wort may decrease pravastatin levels.

Monitoring ParametersObtain baseline LFTs and total cholesterol profile; creatine phosphokinase due to possibility of myopathy. Repeat LFTs prior to elevation of dose. May be measured when clinically indicated and/or periodically thereafter.

Nursing: Physical Assessment/MonitoringUse caution with history of hepatic disease. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, other lipid-lowering agents may increase risk of myopathy or rhabdomyolysis). Evaluate results of laboratory tests (LFTs and lipid profile) at baseline and periodically. Assess patient response on a regular basis throughout therapy (eg, rash, myalgia, gastrointestinal effects). Teach patient proper use (as adjunct to diet and exercise program), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to women of childbearing age unless they are capable of complying with effective contraceptive use. Instruct patient in appropriate contraceptive measures.

Monitoring: Lab TestsObtain baseline LFTs and total cholesterol profile; creatine phosphokinase due to possibility of myopathy. Repeat

LFTs prior to elevation of dose. May be measured when clinically indicated and/or periodically thereafter.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take at same time each day with or without food. Follow cholesterol-lowering diet and exercise regimen as prescribed. Avoid excess alcohol. You will have periodic blood tests to assess effectiveness. You may experience mild nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help); constipation (increased exercise, fruit, fluids, or fiber may help); or headache, dizziness, or insomnia (use caution when driving or engaged in potentially hazardous tasks until response to drug in known). Contact prescriber immediately with persistent muscle pain or cramping, skeletal or joint pain, or numbness. Report other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber for appropriate barrier contraceptive measures to use during and for 1 month following therapy. This drug may cause severe fetal defects. Do not donate blood during or for 1 month following therapy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as sodium: 10 mg, 20 mg, 40 mg, 80 mg

Pravachol®: 10 mg; 20 mg [DSC]; 40 mg, 80 mg

Generic AvailableYes

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (Pravachol)

10 mg (30): $119.99

20 mg (30): $114.99

40 mg (30): $169.98

80 mg (30): $191.66

Tablets (Pravastatin Sodium)

10 mg (30): $18.99

20 mg (30): $27.00

40 mg (30): $25.99

80 mg (30): $119.99

Mechanism of ActionPravastatin is a competitive inhibitor of 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase, which is the rate-limiting enzyme involved in *de novo* cholesterol synthesis.

Pharmacodynamics/Kinetics

Onset of action: Several days

Peak effect: 4 weeks

Absorption: Rapidly absorbed; average absorption 34%

Protein binding: 50%

Metabolism: Hepatic to at least two metabolites

Bioavailability: 17%

Half-life elimination: ~2-3 hours

Time to peak, serum: 1-1.5 hours

Excretion: Feces (70%); urine (≤20%, 8% as unchanged drug)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

Primary Prevention: HMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

HMG-CoA reductase inhibitors decrease C-reactive protein (CRP), an inflammatory marker and an acute phase reactant. Elevated levels of high sensitive CRP (hsCRP), which detects CRP levels as low as 0.175 mg/L, have been shown to be associated with an increased risk of cardiovascular events. Recently, the JUPITER trial demonstrated that the use of rosuvastatin in healthy patients (men ≥ 50 years and women ≥ 60 years) without a history of cardiovascular disease with LDL <130 mg/dL and a hsCRP level ≥ 2 mg/L reduced the risk of major cardiovascular events (eg, nonfatal MI, stroke, death from cardiovascular causes), The number needed to treat over 5 years to prevent 1 cardiovascular event is 25. Current guidelines do not recommend drug treatment for patients with an LDL <130 mg/dL. However, identification of the patient at higher risk of cardiovascular events within this subgroup using hsCRP is now important given that statins may prevent the occurrence of these serious cardiovascular events (Ridker, 2008).

Secondary Prevention: Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; $p <0.001$). There was no mortality difference between the two treatment groups.

In addition to the ability of HMG-CoA reductase inhibitors to decrease levels of high-sensitivity C-reactive protein (hs-CRP), they also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other Considerations**Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(pray zi KWON tel)
U.S. Brand NamesBiltricide®
Canadian Brand NamesBiltricide®
Pharmacologic CategoryAnthelmintic
Use: Labeled IndicationsAll stages of schistosomiasis caused by all *Schistosoma* species pathogenic to humans; clonorchiasis and opisthorchiasis
Use: Unlabeled/InvestigationalCysticercosis and many intestinal tapeworms
Dosing: Adults

Schistosomiasis: Oral: 20 mg/kg/dose 2-3 times/day for 1 day at 4- to 6-hour intervals

Flukes (unlabeled use): Oral: 25 mg/kg/dose every 8 hours for 1-2 days

Cysticercosis (unlabeled use): Oral: 50 mg/kg/day divided every 8 hours for 14 days

Tapeworms (unlabeled use): Oral: 10-20 mg/kg as a single dose (25 mg/kg for *Hymenolepis nana*)

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren >4 years: Refer to adult dosing.
Administration: OralTablets may be halved or quartered.
ContraindicationsHypersensitivity to praziquantel or any component of the formulation; ocular cysticercosis
Warnings/Precautions

Disease-related concerns:

- Cerebral cysticercosis: Patients with cerebral cysticercosis require hospitalization.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

Concurrent drug therapy issues:

- Strong inducers of cytochrome P450: Use caution with concurrent administration of strong inducers of cytochrome P450; therapeutic levels of praziquantel may not be achieved.

Pregnancy Risk FactorB
LactationEnters breast milk
Adverse Reactions

1% to 10%:

Central nervous system: Dizziness, drowsiness, headache, malaise, CSF reaction syndrome in patients being treated for neurocysticercosis

Gastrointestinal: Abdominal pain, loss of appetite, nausea, vomiting

Miscellaneous: Diaphoresis

<1%: Diarrhea, fever, itching, rash, urticaria

Metabolism/Transport Effects**Inhibits** CYP2D6 (weak)
Drug Interactions

Aminoquinolines (Antimalarial): May decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Praziquantel. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ketoconazole: May increase the serum concentration of Praziquantel. Management: Praziquantel dose may need to be reduced when used with ketoconazole. *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Praziquantel. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringSee Warnings/Precautions and Contraindications for use cautions. Worm infestations are easily transmitted, all close family members should be treated. Instruct patient/caregiver on appropriate use, transmission prevention, possible side effects/appropriate interventions, and adverse symptoms to report (see Patient Education).

Monitoring: Lab TestsCulture urine or feces for ova prior to instituting therapy.

Patient EducationTake exactly as directed for full course of medication. Tablets may be chewed, swallowed whole, or crushed and mixed with food. Increase dietary intake of fruit juices. All family members and close friends should also be treated. To reduce possibility of reinfection, wash hands and scrub nails carefully with soap and hot water before handling food, before eating, and before and after toileting. Keep hands out of mouth. Disinfect toilet daily and launder bed linens, undergarments, and nightclothes daily with hot water and soap. Do not go barefoot and do not sit directly on grass or ground. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or abdominal pain, nausea, or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report unusual fatigue, persistent dizziness, CNS changes, change in color of urine or stool, or easy bruising or unusual bleeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet [tri-scored]: 600 mg

Generic AvailableNo

ManufacturerBayer Corp (Biological and Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (Biltricide)

600 mg (6): $77.70

Mechanism of ActionIncreases the cell permeability to calcium in schistosomes, causing strong contractions and paralysis of worm musculature leading to detachment of suckers from the blood vessel walls and to dislodgment

Pharmacodynamics/Kinetics

Absorption: Oral: ~80%

Distribution: CSF concentration is 14% to 20% of plasma concentration; enters breast milk

Protein binding: ~80%

Metabolism: Extensive first-pass effect

Half-life elimination: Parent drug: 0.8-1.5 hours; Metabolites: 4.5 hours

Time to peak, serum: 1-3 hours

Excretion: Urine (99% as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Prazosin may be confused with predniSONE

International issues:

Prazac® [Denmark] may be confused with Prozac® which is a brand name for fluoxetine in the U.S.

Prazepam [multiple international markets] may be confused with prazosin.

Pronunciation(PRAZ oh sin)

U.S. Brand NamesMinipress®

Canadian Brand NamesApo-Prazo®; Minipress®; Novo-Prazin; Nu-Prazo

Pharmacologic CategoryAlpha$_1$ Blocker

Use: Labeled IndicationsTreatment of hypertension

Use: Unlabeled/InvestigationalPost-traumatic stress disorder (PTSD); benign prostatic hyperplasia; Raynaud's syndrome

Dosing: Adults

Hypertension: Oral: Initial: 1 mg/dose 2-3 times/day; usual maintenance dose: 3-15 mg/day in divided doses 2-4 times/day; maximum daily dose: 20 mg

Hypertensive urgency: Oral: 10-20 mg once, may repeat in 30 minutes

PTSD (unlabeled use): Initial: 2 mg at bedtime; titrate as tolerated to 10-15 mg at bedtime

Raynaud's (unlabeled use): Oral: 0.5-3 mg twice daily

Benign prostatic hyperplasia (unlabeled use): Oral: 2 mg twice daily

Dosing: ElderlyOral (first dose given at bedtime): Initial: 1 mg 1-2 times/day

Dosing: PediatricOral: Children (unlabeled use): Initial: 0.05-0.1 mg/kg/day in 3 divided doses; maximum: 0.5 mg/kg/day

StorageStore in airtight container. Protect from light.

ContraindicationsHypersensitivity to quinazolines (doxazosin, prazosin, terazosin) or any component of the formulation; concurrent use with phosphodiesterase-5 (PDE-5) inhibitors including sildenafil (>25 mg), tadalafil, or vardenafil

Allergy Considerations

- Alpha-Blocker, Piperazinyl Quinazoline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina: Discontinue if symptoms of angina occur or worsen.
- Orthostatic hypotension/syncope: May cause significant orthostatic hypotension and syncope, especially with first dose; anticipate a similar effect if therapy is interrupted for a few days, if dosage is rapidly increased, or if another antihypertensive drug (particularly vasodilators) or a PDE-5 inhibitor is introduced. Patients should be cautioned about performing hazardous tasks when starting new therapy or adjusting dosage upward.

Disease-related concerns:

- Prostate cancer: Should rule out prostatic carcinoma before beginning therapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsAdverse effects such as dry mouth and urinary problems can be particularly bothersome in elderly.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Central nervous system: Dizziness (10%)

1% to 10%:

Cardiovascular: Palpitation (5%), edema, orthostatic hypotension, syncope (1%)

Central nervous system: Headache (8%), drowsiness (8%), vertigo, depression, nervousness

Dermatologic: Rash (1% to 4%)

Endocrine & metabolic: Decreased energy (7%)

Gastrointestinal: Nausea (5%), vomiting, diarrhea, constipation

Genitourinary: Urinary frequency (1% to 5%)

Neuromuscular & skeletal: Weakness (7%)

Ocular: Blurred vision, reddened sclera, xerostomia

Respiratory: Dyspnea, epistaxis, nasal congestion

<1% (Limited to important or life-threatening): Abdominal discomfort, alopecia, angina, bradycardia, cataracts (both development and disappearance have been reported), hallucinations, impotence, incontinence, lichen planus, liver function abnormalities, MI, narcolepsy (worsened), pancreatitis, paresthesia, pigmentary mottling and serous retinopathy, priapism, pruritus, tachycardia, tinnitus

Postmarketing and/or case reports: Allergic reaction, cataplexy, enuresis, eye pain, gynecomastia, leukopenia, systemic lupus erythematosus, urticaria, vasculitis

Drug Interactions

Alfuzosin: Alpha1-Blockers may enhance the antihypertensive effect of Alfuzosin. Risk of orthostatic hypotension or syncope may be increased. Alfuzosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Alpha1-Blockers may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the hypotensive effect of Alpha1-Blockers. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Silodosin: Alpha1-Blockers may enhance the adverse/toxic effect of Silodosin. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. Silodosin may enhance the hypotensive effect of Alpha1-Blockers. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. *Risk X: Avoid combination*

Tamsulosin: Alpha1-Blockers may enhance the antihypertensive effect of Tamsulosin. Risk of orthostatic hypotension or syncope may be increased. Tamsulosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase vasodilation).

Food: Food has variable effects on absorption.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid saw palmetto (due to limited experience with this combination). Avoid garlic (may have increased antihypertensive effect).

Test InteractionsIncreased urinary VMA 17%, norepinephrine metabolite 42%

Monitoring ParametersBlood pressure, standing and sitting/supine

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, anything that may affect blood pressure [beta-blockers, diuretics, ACE inhibitors, calcium channel blockers, dong quai] and any PDE-5 inhibitors [sildenafil, tadalafil, vardenafil]). Evaluate therapeutic effectiveness (cardiac status and blood pressure) and adverse reactions (eg, orthostatic hypotension, rash, drowsiness, nausea, vomiting) at beginning of therapy and on a regular basis with long-term therapy. When discontinuing, monitor blood pressure and taper dose slowly over 1 week or more. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Take as directed, at same time each day, with or without meals; do not skip dose or discontinue without consulting prescriber. Avoid alcohol. Follow recommended diet and exercise program. May cause drowsiness, dizziness, or impaired judgment (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from sitting or lying position or when climbing stairs); or dry mouth or nausea (frequent mouth care or sucking lozenges may help). Report increased nervousness or depression; sudden weight gain (weigh yourself in the same clothes at the same time of day once a week); palpitations or rapid heartbeat; respiratory difficulty; muscle weakness, fatigue, or pain; vision changes or hearing; rash; changes in urinary pattern (void before taking medications); or other persistent side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 1 mg, 2 mg, 5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Minipress)

1 mg (60): $29.99

2 mg (60): $60.42

5 mg (60): $101.17

Capsules (Prazosin HCl)

1 mg (60): $17.99

2 mg (60): $22.99

5 mg (60): $33.99

Mechanism of ActionCompetitively inhibits postsynaptic alpha-adrenergic receptors which results in vasodilation of veins and arterioles and a decrease in total peripheral resistance and blood pressure

Pharmacodynamics/Kinetics

Onset of action: BP reduction: ~2 hours

Maximum decrease: 2-4 hours

Duration: 10-24 hours

Distribution: Hypertensive adults: V_d: 0.5 L/kg

Protein binding: 92% to 97%

Metabolism: Extensively hepatic

Bioavailability: 43% to 82%

Half-life elimination: 2-4 hours; prolonged with congestive heart failure

Excretion: Urine (6% to 10% as unchanged drug)

Related Information

- Depression

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation). Significant orthostatic hypotension is a possibility; monitor patient when getting out of dental chair.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause drowsiness or nervousness; may rarely cause nightmares

Mental Health: Effects on Psychiatric TreatmentConcurrent use with low potency antipsychotics and TCAs may increase risk of postural hypotension

Cardiovascular ConsiderationsAn alpha$_1$ blocker may be used in combination with other agents for the treatment of hypertension or alone in select patients who fail to respond or have contraindications to other agents. Patients with BPH may derive an extra benefit from therapy. Recently, the doxazosin treatment arm of ALLHAT (Antihypertensive and Lipid-Lowering Treatment to Prevent Heart Attack Trial) was prematurely stopped due to a significantly higher incidence (25%) of cardiovascular events, particularly heart failure events, compared to the diuretic (chlorthalidone) treatment arm. This unfavorable difference was also present when doxazosin was compared to the amlodipine and lisinopril treatment arms. This study does not address cardiovascular outcomes when doxazosin is combined with other antihypertensive medications. Consideration should be given to the ALLHAT results when considering the use of an alpha$_1$ blocker for treatment of hypertension.

Anesthesia and Critical Care Concerns/Other ConsiderationsAlpha$_1$ blockers do not affect renal blood flow or glomerular filtration. Orthostatic hypotension, compared to newer alpha-blockers, is more of a concern.

Index TermsFurazosin; Prazosin Hydrochloride

Prednicarbate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Dermatop® may be confused with Dimetapp®

Pronunciation(pred ni KAR bate)

U.S. Brand NamesDermatop®

Canadian Brand NamesDermatop®

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsRelief of the inflammatory and pruritic manifestations of corticosteroid-responsive dermatoses (medium potency topical corticosteroid)

Dosing: Adults**Steroid-responsive dermatoses:** Topical: Apply a thin film to affected area twice daily. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to prednicarbate or any component of the formulation; fungal, viral, or tubercular skin lesions, herpes simplex or zoster

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Disease-related concerns:

- Diaper dermatitis: Do not use for diaper dermatitis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 year of age. Chronic use of corticosteroids in children may interfere with growth and development.

Geriatric ConsiderationsDue to age-related changes in skin, limit use of topical corticosteroids.

Pregnancy Risk FactorC

Adverse Reactions

1% to 10%: Dermatologic: Skin atrophy, shininess, thinness, mild telangiectasia

<1%: Pruritus, edema, urticaria, burning, allergic contact dermatitis and rash, folliculitis, acneiform eruptions, hypopigmentation, perioral dermatitis, secondary infection, striae, miliaria, paresthesia

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersRelief of symptoms

Patient EducationUse only as prescribed and for no longer than the period prescribed. Apply sparingly in a thin film and rub in lightly. Avoid contact with eyes. Do not apply to the face, underarms, or groin areas. Notify prescriber if condition persists or worsens.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream: 0.1% (15 g, 60 g)

Dermatop®: 0.1% (15 g [DSC], 60 g)

Ointment: 0.1% (15 g, 60 g)

Dermatop®: 0.1% (15 g [DSC], 60 g)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Cream (Dermatop)

0.1% (60): $75.20

Cream (Prednicarbate)

0.1% (60): $57.99

Ointment (Dermatop)

0.1% (15): $21.99

0.1% (60): $43.99

Ointment (Prednicarbate)

0.1% (15): $27.97

0.1% (60): $54.99

Mechanism of ActionTopical corticosteroids have anti-inflammatory, antipruritic, vasoconstrictive, and antiproliferative actions

Pharmacotherapy PearlsHas been shown that the atrophic activity of prednicarbate is many times less than agents with similar clinical potency, nevertheless, avoid use on the face.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Prednisolone and Gentamicin

English

English

Jump To Field (Select Field Name)

Pronunciation(pred NIS oh lone & jen ta MYE sin)

U.S. Brand NamesPred-G®

Pharmacologic Category[Antibiotic/Corticosteroid, Ophthalmic]

Use: Labeled IndicationsTreatment of steroid responsive inflammatory conditions and superficial ocular infections due to microorganisms susceptible to gentamicin

Dosing: Adults**Inflammatory conditions and superficial ocular infections:** Ophthalmic:

Ointment: Apply $^{1}/_{2}$ inch ribbon in the conjunctival sac 1-3 times/day

Suspension: 1 drop 2-4 times/day; during the initial 24-48 hours, the dosing frequency may be increased if necessary up to 1 drop every hour

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: OtherOphthalmic:

Ointment: For topical application into the conjunctival sac

Suspension: For topical application to the eye only; shake suspension well before using; do not inject subconjunctivally or introduce into the anterior chamber of the eye

ContraindicationsHypersensitivity to gentamicin, prednisolone, other aminoglycosides or corticosteroids, or any component of the formulation; viral disease of the cornea and conjunctiva (including epithelia herpes simplex keratitis, vaccinia, varicella); mycobacterial or fungal infection of the eye; uncomplicated removal of a corneal foreign body

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.
- Ocular effects: Prolonged use of corticosteroids may result in glaucoma; damage to the optic nerve, defects in visual acuity and fields of vision, and posterior subcapsular cataract formation may occur.

Special populations:

- Cataract surgery patients: Use following cataract surgery may delay healing or increase the incidence of bleb formation.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only. A maximum of 20 mL of suspension should be prescribed initially; patients should be evaluated prior to additional refills. Prescriptions extending beyond 14 days should include exams using magnification.

Geriatric ConsiderationsNo specific recommendations for use in the elderly necessary.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is unknown if topical use results in sufficient absorption to produce detectable quantities in breast milk.

Adverse ReactionsFrequency not defined.

Dermatologic: Delayed wound healing

Local: Burning, stinging

Ocular: Intraocular pressure increased, glaucoma, superficial punctate keratitis, optic nerve damage (infrequent), posterior subcapsular cataract formation

Miscellaneous: Secondary infection

Metabolism/Transport EffectsPrednisolone: **Substrate** of CYP3A4 (minor); **Inhibits** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment, ophthalmic:

Pred-G®: Prednisolone acetate 0.6% and gentamicin sulfate 0.3% (3.5 g)

Suspension, ophthalmic:

Pred-G®: Prednisolone acetate 1% and gentamicin sulfate 0.3% (5 mL, 10 mL) [contains benzalkonium chloride]

Medication Safety Issues

Sound-alike/look-alike issues:

PrednisoLONE may be confused with predniSONE

Pediapred® may be confused with Pediazole®

Pronunciation(pred NISS oh lone)
U.S. Brand NamesEconopred® Plus [DSC]; Millipred™; Omnipred™; Orapred ODT™; Orapred®; Pediapred®; Pred Forte®; Pred Mild®; Prelone®
Canadian Brand NamesDiopred®; Hydeltra T.B.A.®; Inflamase® Mild; Novo-Prednisolone; Ophtho-Tate®; Pediapred®; Pred Forte®; Pred Mild®; Sab-Prenase
Pharmacologic CategoryCorticosteroid, Ophthalmic; Corticosteroid, Systemic
Use: Labeled IndicationsTreatment of palpebral and bulbar conjunctivitis; corneal injury from chemical, radiation, thermal burns, or foreign body penetration; endocrine disorders, rheumatic disorders, collagen diseases, dermatologic diseases, allergic states, ophthalmic diseases, respiratory diseases, hematologic disorders, neoplastic diseases, edematous states, and gastrointestinal diseases; resolution of acute exacerbations of multiple sclerosis; management of fulminating or disseminated tuberculosis and trichinosis; acute or chronic solid organ rejection
Use: DentalTreatment of a variety of oral diseases of allergic, inflammatory, or autoimmune origin
Dosing: AdultsDose depends upon condition being treated and response of patient. Oral dosage expressed in terms of prednisolone base. Consider alternate day therapy for long-term therapy. Discontinuation of long-term therapy requires gradual withdrawal by tapering the dose. Patients undergoing unusual stress while receiving corticosteroids, should receive increased doses prior to, during, and after the stressful situation.

Usual dose (range): Oral: 5-60 mg/day

Rheumatoid arthritis: Oral: Initial: 5-7.5 mg/day, adjust dose as necessary

Multiple sclerosis: Oral: 200 mg/day for 1 week followed by 80 mg every other day for 1 month

Conjunctivitis: Ophthalmic (suspension/solution): Instill 1-2 drops into conjunctival sac every hour during day, every 2 hours at night until favorable response is obtained, then use 1 drop every 4 hours.

Dosing adjustment in hyperthyroidism: Prednisolone dose may need to be increased to achieve adequate therapeutic effects.

Dosing: ElderlyUse lowest effective adult dose. Dose depends upon condition being treated and response of patient; alternate day dosing may be attempted in some disease states.
Dosing: PediatricDose depends upon condition being treated and response of patient; dosage for infants and children should be based on severity of the disease and response of the patient rather than on strict adherence to dosage indicated by age, weight, or body surface area. Oral dosage expressed in terms of prednisolone base. Consider alternate day therapy for long-term therapy. Discontinuation of long-term therapy requires gradual withdrawal by tapering the dose. Patients undergoing unusual stress while receiving corticosteroids, should receive increased doses prior to, during, and after the stressful situation.

Acute asthma: Oral: 1-2 mg/kg/day in divided doses 1-2 times/day for 3-5 days

Anti-inflammatory or immunosuppressive dose: Oral: 0.1-2 mg/kg/day in divided doses 1-4 times/day

Nephrotic syndrome: Oral:

Initial (first 3 episodes): 2 mg/kg/day **or** 60 mg/m^2/day (maximum: 80 mg/day) in divided doses 3-4 times/day until urine is protein free for 3 consecutive days (maximum: 28 days); followed by 1-1.5 mg/kg/dose **or** 40 mg/m^2/dose given every other day for 4 weeks

Maintenance (for frequent relapses): 0.5-1 mg/kg/dose given every other day for 3-6 months

Conjunctivitis: Ophthalmic (suspension/solution): Children: Refer to adult dosing.

Dosing adjustment in hyperthyroidism: Refer to adult dosing.

Dosing: Renal ImpairmentSlightly dialyzable (5% to 20%)
Dosing: Combination Regimens

Lymphoma, Hodgkin's:

LOPP

MOPP

Calculations

- Corticosteroid Conversion

Administration: OralAdminister oral formulation with food or milk to decrease GI effects.

Orapred ODT™: Do not break or use partial tablet. Remove tablet from blister pack just prior to use. May swallow whole or allow to dissolve on tongue.

Dietary ConsiderationsShould be taken after meals or with food or milk to decrease GI effects; increase dietary intake of pyridoxine, vitamin C, vitamin D, folate, calcium, and phosphorus.

StorageStore Orapred ODT™ at 20°C to 25°C (68°F to 77°F) in blister pack. Protect from moisture.

ContraindicationsHypersensitivity to prednisolone or any component of the formulation; acute superficial herpes simplex keratitis; live or attenuated virus vaccines (with immunosuppressive doses of corticosteroids); systemic fungal infections; varicella

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections) or prolong or exacerbate viral infections. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria or viral hepatitis. Use with caution in patients with tuberculosis.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Myopathy: Acute myopathy has been reported with high dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.

- Ocular effects: Prolonged use of corticosteroids may result in glaucoma; damage to the optic nerve (not indicated for treatment of optic neuritis), defects in visual acuity and fields of vision, and posterior subcapsular cataract formation may occur. Use following cataract surgery may delay healing or increase the incidence of bleb formation.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarction (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration.

- Pediatrics: May affect growth velocity; growth should be routinely monitored in pediatric patients.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw therapy with gradual tapering of dose.

Geriatric ConsiderationsUseful in patients with inability to activate prednisone (liver disease). Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly, in the smallest possible dose, and for the shortest possible time. For long-term use, monitor bone mineral density and institute fracture prevention strategies.

Pregnancy Risk FactorC

Pregnancy ConsiderationsOphthalmic prednisolone was shown to be teratogenic in animal studies and adverse events have been observed with corticosteroids in animal reproduction studies. Prednisolone crosses the placenta; prior to reaching the fetus, prednisolone is converted by placental enzymes to prednisone. As a result, the amount of prednisolone reaching the fetus is ~8-10 times lower than the maternal serum concentration (healthy women at term; similar results observed with preterm pregnancies complicated by HELLP syndrome). Some studies have shown an association between first trimester corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy. Women exposed to prednisolone during pregnancy for the treatment of an autoimmune disease may contact the OTIS Autoimmune Diseases Study at 877-311-8972.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsPrednisolone is excreted into breast milk with peak concentrations occurring ~1 hour after the maternal dose. The milk/plasma ratio was found to be 0.2 with doses ≥30 mg/day and 0.1 with doses <30 mg/day. Following a maternal dose of prednisolone 80 mg/day, a breast-feeding infant would ingest <0.1% of the dose.

Adverse ReactionsFrequency not defined.

Ophthalmic formulation:

Endocrine & metabolic: Hypercorticoidism (rare)

Ocular: Conjunctival hyperemia, conjunctivitis, corneal ulcers, delayed wound healing, glaucoma, intraocular pressure increased, keratitis, loss of accommodation, optic nerve damage, mydriasis, posterior subcapsular cataract formation, ptosis, secondary ocular infection

Oral formulation:

Cardiovascular: Cardiomyopathy, CHF, edema, facial edema, hypertension

Central nervous system: Convulsions, headache, insomnia, malaise, nervousness, pseudotumor cerebri, psychic disorders, vertigo

Dermatologic: Bruising, facial erythema, hirsutism, petechiae, skin test reaction suppression, thin fragile skin, urticaria

Endocrine & metabolic: Carbohydrate tolerance decreased, Cushing's syndrome, diabetes mellitus, growth suppression, hyperglycemia, hypernatremia, hypokalemia, hypokalemic alkalosis, menstrual irregularities, negative nitrogen balance, pituitary adrenal axis suppression

Gastrointestinal: Abdominal distention, increased appetite, indigestion, nausea, pancreatitis, peptic ulcer, ulcerative esophagitis, weight gain

Hepatic: LFTs increased (usually reversible)

Neuromuscular & skeletal: Arthralgia, aseptic necrosis (humeral/femoral heads), fractures, muscle mass decreased, muscle weakness, osteoporosis, steroid myopathy, tendon rupture, weakness

Ocular: Cataracts, exophthalmus, eyelid edema, glaucoma, intraocular pressure increased, irritation

Respiratory: Epistaxis

Miscellaneous: Diaphoresis increased, impaired wound healing

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase gastric mucosal irritation).

Food: Prednisolone interferes with calcium absorption. Limit caffeine.

Herb/Nutraceutical: St John's wort may decrease prednisolone levels. Avoid cat's claw, echinacea (have immunostimulant properties).

Test InteractionsResponse to skin tests

Monitoring ParametersBlood pressure; blood glucose, electrolytes; intraocular pressure (use >6 weeks); bone mineral density

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse effects according to indications for therapy, dose, route, and duration of therapy. With systemic administration, patients with diabetes should monitor glucose levels closely. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. When used for long-term therapy (>10-14 days), do not discontinue abruptly; decrease dosage incrementally.

Monitoring: Lab TestsBlood glucose, electrolytes

Patient EducationTake exactly as directed; do not increase dose or discontinue abruptly without consulting prescriber. Avoid alcohol. Limit intake of caffeine or stimulants. Prescriber may recommend increased dietary vitamins, minerals, or iron. If you have diabetes, monitor glucose levels closely (antidiabetic medication may need to be adjusted). Inform prescriber if you are experiencing greater-than-normal levels of stress (medication may need adjustment). Some forms of this medication may cause GI upset (oral medication should be taken with meals to reduce GI upset; small frequent meals and frequent mouth care may reduce GI upset). You may be more susceptible to infection (avoid crowds and exposure to infection). Report promptly excessive nervousness or sleep disturbances; any signs of infection (sore throat, unhealed injuries); excessive growth of body hair or loss of skin color; vision changes; excessive or sudden weight gain (>3 lb/week); swelling of face or extremities; respiratory difficulty; muscle weakness; change in color of stools (black or tarry) or persistent abdominal pain; or worsening of condition or failure to improve. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Ophthalmic: For ophthalmic use only. Wash hands before using. Tilt head back and look upward. Put drops of suspension inside lower eyelid. Close eye and roll eyeball in all directions. Do not blink for 1/2 minute. Apply gentle pressure to inner corner of eye for 30 seconds. Do not use any other eye preparation for at least 10 minutes. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Do not share medication with anyone else. Wear sunglasses when in sunlight; you may be more sensitive to bright light. Inform prescriber if condition worsens or fails to improve or if you experience eye pain, disturbances of vision, or other adverse eye response.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, ophthalmic, as sodium phosphate: 1% (5 mL, 10 mL, 15 mL) [contains benzalkonium chloride]

Solution, oral, as base: Prednisolone 15 mg/5 mL (240 mL, 480 mL)

Solution, oral, as sodium phosphate: Prednisolone base 5 mg/5 mL (120 mL, 240 mL); prednisolone base 15 mg/5 mL (240 mL)

Millipred™: 13.4 mg/5 mL (237 mL) [equivalent to prednisolone base 10 mg/5 mL; dye free; grape flavor]

Orapred®: 20 mg/5 mL (20 mL, 240 mL) [equivalent to prednisolone base 15 mg/5 mL; dye free; contains alcohol 2%, sodium benzoate; grape flavor]

Pediapred®: 6.7 mg/5 mL (120 mL) [equivalent to prednisolone base 5 mg/5 mL; dye free; raspberry flavor]

Suspension, ophthalmic, as acetate: 1% (5 mL, 10 mL, 15 mL)

Econopred® Plus [DSC], Omnipred™: 1% (5 mL, 10 mL) [contains benzalkonium chloride]

Pred Forte®: 1% (1 mL, 5 mL, 10 mL, 15 mL) [contains benzalkonium chloride and sodium bisulfite]

Pred Mild®: 0.12% (5 mL, 10 mL) [contains benzalkonium chloride and sodium bisulfite]

Syrup, as base: 5 mg/5 mL (120 mL); 15 mg/5 mL (5 mL [DSC], 240 mL, 480 mL)

Prelone®: 15 mg/5 mL (240 mL, 480 mL) [contains alcohol 5%, benzoic acid; cherry flavor]

Tablet, as base: 5 mg

Tablet, orally disintegrating, as sodium phosphate [strength expressed as base]:

Orapred ODT™: 10 mg, 15 mg, 30 mg [grape flavor]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Pediapred)

6.7 mg/5 mL (120): $42.38

Solution (PrednisoLONE Sodium Phosphate)

Syrup (PrednisoLONE)

15 mg/5 mL (120): $52.00

Tablet, orally-disintegrating (Orapred ODT)

15 mg (48): $257.22

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability; suppresses the immune system by reducing activity and volume of the lymphatic system

Pharmacodynamics/Kinetics

Duration: 18-36 hours

Protein binding (concentration dependent): 65% to 91%; decreased in elderly

Metabolism: Primarily hepatic, but also metabolized in most tissues, to inactive compounds

Half-life elimination: 3.6 hours; End-stage renal disease: 3-5 hours

Excretion: Primarily urine (as glucuronides, sulfates, and unconjugated metabolites)

Related Information

- Corticosteroids

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Ulcerative esophagitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNervousness and insomnia are common; may rarely cause delirium, mood swings, euphoria, and hallucinations

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease corticosteroid effectiveness

Cardiovascular ConsiderationsLong-term steroid therapy is associated with fluid retention and hypertension. Glucocorticoid agents have some mineralocorticoid activity with consequent hemodynamic effects. Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. In discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia.

Steroid therapy in patients with heart failure should be administered cautiously with special attention given to signs and symptoms of fluid retention.

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Neuromuscular Effects: ICU-acquired paresis was recently studied in five ICUs (three medical and two surgical ICUs) at four French hospitals. All ICU patients without pre-existing neuromuscular disease admitted from March 1999 through June 2000 were evaluated (de Jonghe, 2002). Each patient had to be mechanically-ventilated for ≥ 7 days and was screened daily for awakening. The first day the patient was considered awake was Study Day 1. Patients with severe muscle weakness on Study Day 7 were considered to have ICU-acquired paresis. Among the 95 patients who were evaluated, about 25% developed ICU-acquired paresis. Independent predictors included female gender, the number of days with ≥ 2 organ dysfunction, and administration of corticosteroids. Further studies may be required to verify and characterize the association between the development of ICU-acquired paresis and use of corticosteroids. Concurrent use of a corticosteroid and muscle relaxant appears to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible.

Adrenal Insufficiency: Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. When discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia. Patients on long-term steroid supplementation will require higher corticosteroid doses when subject to stress (eg, trauma, surgery, severe infection). Guidelines for glucocorticoid replacement during various surgical procedures have been published (Coursin, 2002; Salem, 1994).

Index TermsDeltahydrocortisone; Metacortandralone; Prednisolone Acetate; Prednisolone Acetate, Ophthalmic; Prednisolone Sodium Phosphate; Prednisolone Sodium Phosphate, Ophthalmic

Medication Safety Issues

Sound-alike/look-alike issues:

PredniSONE may be confused with methylPREDNISolone, Pramosone®, prazosin, prednisoLONE, Prilosec®, primidone, promethazine

Pronunciation(PRED ni sone)
U.S. Brand NamesPredniSONE Intensol™; Sterapred®; Sterapred® DS
Canadian Brand NamesApo-Prednisone®; Novo-Prednisone; Winpred™
Pharmacologic CategoryCorticosteroid, Systemic
Use: Labeled IndicationsTreatment of a variety of diseases, including:

Allergic states (including adjunctive treatment of anaphylaxis)

Autoimmune disorders (including systemic lupus erythematosus [SLE])

Collagen diseases

Dermatologic conditions/diseases

Edematous states (including nephrotic syndrome)

Endocrine disorders

Gastrointestinal diseases

Hematologic disorders (including idiopathic thrombocytopenia purpura [ITP])

Multiple sclerosis exacerbations

Neoplastic diseases

Ophthalmic diseases

Respiratory diseases (including acute asthma exacerbation)

Rheumatic disorders (including rheumatoid arthritis)

Trichinosis with neurologic or myocardial involvement

Tuberculous meningitis

Use: Unlabeled/InvestigationalAdjunctive therapy for *Pneumocystis jiroveci* (formerly *carinni*) pneumonia (PCP); autoimmune hepatitis; adjunctive therapy for pain management in immunocompetent patients with herpes zoster; tuberculosis (severe, paradoxical reactions)
Use: DentalTreatment of a variety of oral diseases of allergic, inflammatory, or autoimmune origin
Dosing: Adults**General dosing range:** Oral: Initial: 5-60 mg/day: **Note:** Dose depends upon condition being treated and response of patient; dosage for infants and children should be based on severity of the disease and response of the patient rather than on strict adherence to dosage indicated by age, weight, or body surface area. Consider alternate day therapy for long-term therapy. Discontinuation of long-term therapy requires gradual withdrawal by tapering the dose.

Prednisone taper (other regimens also available):

Day 1: 30 mg divided as 10 mg before breakfast, 5 mg at lunch, 5 mg at dinner, 10 mg at bedtime

Day 2: 5 mg at breakfast, 5 mg at lunch, 5 mg at dinner, 10 mg at bedtime

Day 3: 5 mg 4 times/day (with meals and at bedtime)

Day 4: 5 mg 3 times/day (breakfast, lunch, bedtime)

Day 5: 5 mg 2 times/day (breakfast, bedtime)

Day 6: 5 mg before breakfast

Indication-specific dosing:

Acute asthma (NIH guidelines, 2007): Oral: 40-60 mg per day for 3-10 days; administer as single or 2divided doses

Anaphylaxis, adjunctive treatment (Lieberman 2005): Oral: 0.5 mg/kg

Antineoplastic: Oral: Usual range: 10 mg/day to 100 mg/m^2/day (depending on indication). **Note:** Details concerning dosing in combination regimens should also be consulted.

Autoimmune hepatitis (unlabeled use; Czaja 2002): Oral: Initial treatment: 60 mg/day for 1 week, *followed by* 40 mg/day for 1 week, *then* 30 mg/day for 2 weeks, *then* 20 mg/day. Half this dose should be given when used in combination with azathioprine

Herpes zoster (unlabeled use; Dworkin 2007): Oral: 60 mg/day for 7 days, *followed by* 30 mg/day for 7 days, *then* 15 mg/day for 7 days

Idiopathic thrombocytopenia purpura (American Society of Hematology 1997): Oral: 1-2 mg/kg/day

PCP pneumonia (AIDSinfo guidelines, 2008):Note: Begin within 72 hours of PCP therapy: 40 mg twice daily for 5 days, *followed by* 40 mg once daily for 5 days, *followed by* 20 mg once daily for 11 days or until antimicrobial regimen is completed

Rheumatoid arthritis (American College of Rheumatology 2002): Oral: ≤10 mg/day

Systemic lupus erythematosus (American College of Rheumatology 1999): Oral:

Mild SLE: ≤10 mg/day

Refractory or severe organ-threatening disease: 20-60 mg/day

Thyrotoxicosis (type II amiodarone induced; unlabeled use): Oral: 30-40 mg/day for 7-14 days, gradually taper over 3 months

Tuberculosis, severe, paradoxical reactions (unlabeled use, AIDS info guidelines 2008): Oral: 1 mg/kg/day, gradually reduce after 1-2 weeks

Dosing: ElderlyRefer to adult dosing; use the lowest effective dose. Oral dose depends upon condition being treated and response of patient. Alternate day dosing may be attempted.

Dosing: Pediatric

General dosing range: Oral: Refer to adult dosing. **Note:** Dose depends upon condition being treated and response of patient; dosage for infants and children should be based on severity of the disease and response of the patient rather than on strict adherence to dosage indicated by age, weight, or body surface area. Consider alternate day therapy for long-term therapy. Discontinuation of long-term therapy requires gradual withdrawal by tapering the dose.

Indication-specific dosing:

Acute asthma (NIH guidelines, 2007): Oral:

0-11 years 1-2 mg/kg/day for 3-10 days (maximum: 60 mg/day)

≥12 years: Refer to Adults dosing

Autoimmune hepatitis (unlabeled use; Czaja 2002): Oral: Initial treatment: 2 mg/kg/day for 2 weeks (maximum: 60 mg/day), followed by a taper over 6-8 weeks to a dose of 0.1-0.2 mg/kg/day or 5 mg/day

Nephrotic syndrome (Pediatric Nephrology Panel recommendations [Hogg, 2000]): Oral: Initial: 2 mg/kg/day or 60 mg/m^2/day given every day in 1-3 divided doses (maximum: 80 mg/day) until urine is protein free or for 4-6 weeks; followed by maintenance dose: 2 mg/kg/dose or 40 mg/m^2/dose given every other day in the morning; gradually taper and discontinue after 4-6 weeks. **Note:** No definitive treatment guidelines exist. Dosing is dependant on institution protocols and individual response.

PCP pneumonia (AIDSinfo guidelines, 2008): Oral:

Children: 1 mg/kg twice daily for 5 days, *followed by* 0.5-1 mg/kg twice daily for 5 days, *followed by* 0.5 mg/kg once daily for 11-21 days

Adolescents: Refer to adult dosing.

Dosing: Renal ImpairmentHemodialysis effects: Supplemental dose is not necessary.

Dosing: Combination Regimens**Note:** In the U.S., prednisone is the preferred corticosteroid. However, in the British literature, prednisolone is often used. The oral doses of these two agents are equivalent (ie, 1 mg prednisone = 1 mg prednisolone). Also, early clinical trials gave prednisone only with the first and fourth cycles. Some clinicians give prednisone with every cycle.

Calculations

- Corticosteroid Conversion

Administration: OralAdminister with food to decrease GI upset.

Dietary ConsiderationsShould be taken after meals or with food or milk; may require increased dietary intake of pyridoxine, vitamin C, vitamin D, folate, calcium, and phosphorus; may require decreased dietary intake of sodium

ContraindicationsHypersensitivity to any component of the formulation; systemic fungal infections; administration of live or live attenuated vaccines with immunosuppressive doses of prednisone

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Immunosuppression: Prolonged use of corticosteroids may increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided. Corticosteroids should not be used to treat ocular herpes simplex or cerebral malaria. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Myopathy: Acute myopathy has been reported with high dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.

- Ocular effects: Prolonged use may cause posterior subcapsular cataracts, glaucoma (with possible nerve damage) and may increase the risk for ocular infections.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; effects may be enhanced.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarction (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Osteoporosis: Use with caution in patients with or who are at risk for osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Pediatrics: May affect growth velocity; growth should be routinely monitored in pediatric patients.

Other warnings/precautions:

- Appropriate use: Prior to use, the dose and duration of treatment should be based on the risk versus benefit for each individual patient. In general, use the smallest effective dose for the shortest duration of time to minimize adverse events. A gradual tapering of dose may be required prior to discontinuing therapy.

Geriatric ConsiderationsBecause of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly, in the smallest possible dose, and for the shortest possible time.

Pregnancy ConsiderationsAdverse events have been observed with corticosteroids in animal reproduction studies. Prednisone and prednisolone cross the human placenta. In the mother, prednisone is converted to the active metabolite prednisolone by the liver. Prior to reaching the fetus, prednisolone is converted by placental enzymes back to prednisone. As a result, the level of prednisone remaining in the maternal serum and reaching the fetus are similar, however, the amount of prednisolone reaching the fetus is ~8-10 times lower than the maternal serum concentration (healthy women at term). Some studies have shown an association between first trimester prednisone use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy. Pregnant women exposed to prednisone for antirejection therapy following a transplant may contact the National Transplantation Pregnancy Registry (NTPR) at 215-955-4820. Women exposed to prednisone during pregnancy for the treatment of an autoimmune disease (eg, rheumatoid arthritis) may contact the OTIS Autoimmune Diseases Study at 877-311-8972.

LactationEnters breast milk/AAP rates "compatible"

Breast-Feeding ConsiderationsPrednisone and its metabolite prednisolone are found in low concentrations in breast milk. Peak milk concentrations of both were found ~2 hours after the maternal dose in one case report. In a study which included 6 mother/infant pairs, adverse events were not observed in nursing infants (maternal prednisone dose not provided).

Adverse Reactions

Frequency not defined.

Cardiovascular: Congestive heart failure (in susceptible patients), hypertension

Central nervous system: Emotional instability, headache, intracranial pressure increased (with papilledema), psychic derangements (including euphoria, insomnia, mood swings, personality changes, severe depression), seizure, vertigo

Dermatologic: Bruising, facial erythema, petechiae, thin fragile skin, urticaria, wound healing impaired

Endocrine & metabolic: Adrenocortical and pituitary unresponsiveness (in times of stress), carbohydrate intolerance, Cushing's syndrome, diabetes mellitus, fluid retention, growth suppression (in children), hypokalemic alkalosis, hypothyroidism enhanced, menstrual irregularities, negative nitrogen balance due to protein catabolism, potassium loss, sodium retention

Gastrointestinal: Abdominal distension, pancreatitis, peptic ulcer (with possible perforation and hemorrhage), ulcerative esophagitis

Hepatic: ALT increased, AST increased, alkaline phosphatase increased

Neuromuscular & skeletal: Aseptic necrosis of femoral and humeral heads, muscle mass loss, muscle weakness, osteoporosis, pathologic fracture of long bones, steroid myopathy, tendon rupture (particularly Achilles tendon), vertebral compression fractures

Ocular: Exophthalmos, glaucoma, intraocular pressure increased, posterior subcapsular cataracts

Miscellaneous: Allergic reactions, anaphylactic reactions, diaphoresis, hypersensitivity reactions, infections, Kaposi's sarcoma

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Induces** CYP2C19 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Somatropin: May diminish the therapeutic effect of PredniSONE. Growth hormone may reduce the conversion of prednisone to the active prednisolone metabolite. *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase gastric mucosal irritation)

Food: Prednisone interferes with calcium absorption. Limit caffeine.

Herb/Nutraceutical: St John's wort may decrease prednisone levels. Avoid cat's claw, echinacea (have immunostimulant properties).

Test InteractionsDecreased response to skin tests

Monitoring ParametersBlood pressure, blood glucose, electrolytes

Following prolonged use: Bone mass density, growth in children, signs and symptoms of infection, cataract formation

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor for effectiveness of therapy and adverse reactions according to dose and length of therapy. Assess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report (ie, opportunistic infection, adrenal suppression). Instruct patients with diabetes to monitor serum glucose levels closely; corticosteroids can alter glucose tolerance. Monitor growth with long-term use in pediatric patients. Dose may need to be increased if patient is experiencing higher than normal levels of stress. When discontinuing, taper dose and frequency slowly.

Monitoring: Lab TestsBlood glucose, electrolytes

Patient EducationTake exactly as directed. Do not take more than prescribed dose and do not discontinue abruptly; consult prescriber. Take with or after meals. Take once-a-day dose with food in the morning. Avoid alcohol. Limit intake of caffeine or stimulants. Maintain adequate nutrition; consult prescriber for possibility of special dietary recommendations. If you have diabetes, monitor serum glucose closely and notify prescriber of changes; this medication can alter glycemic response. Notify prescriber if you are experiencing higher than normal levels of stress; medication may need adjustment. Periodic ophthalmic examinations will be necessary with long-term use. You will be susceptible to infection (avoid crowds and exposure to infection). You may experience insomnia or nervousness; use caution when driving or engaging in tasks requiring alertness until response to drug is known. Report weakness, change in menstrual pattern, vision changes, signs of hyperglycemia, signs of infection (eg, fever, chills, mouth sores, perianal itching, vaginal discharge), other persistent side effects, or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral: 1 mg/mL (5 mL, 120 mL, 500 mL) [contains alcohol 5%, sodium benzoate; peppermint vanilla flavor]

Solution, oral [concentrate]:

PredniSONE Intensol™: 5 mg/mL (30 mL) [contains alcohol 30%]

Tablet: 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg

Sterapred®: 5 mg [supplied as 21 tablet 6-day unit-dose package or 48 tablet 12-day unit-dose package]

Sterapred® DS: 10 mg [supplied as 21 tablet 6-day unit-dose package or 48 tablet 12-day unit-dose package]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (PredniSONE (Pak))

10 mg (21): $15.99

10 mg (48): $17.99

Tablets (Sterapred DS)

10 mg (21): $59.98

Tablets (Sterapred DS 12 Day)

10 mg (48): $74.36

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability; suppresses the immune system by reducing activity and volume of the lymphatic system; suppresses adrenal function at high doses. Antitumor effects may be related to inhibition of glucose transport, phosphorylation, or induction of cell death in immature lymphocytes. Antiemetic effects are thought to occur due to blockade of cerebral innervation of the emetic center via inhibition of prostaglandin synthesis.

Pharmacodynamics/Kinetics

Absorption: 50% to 90% (may be altered in IBS or hyperthyroidism)

Protein binding (concentration dependent): 65% to 91%

Metabolism: Hepatically converted from prednisone (inactive) to prednisolone (active); may be impaired with hepatic dysfunction

Half-life elimination: Normal renal function: ~3.5 hours

Excretion: Urine (small portion)

Related Information

- Contrast Media Reactions, Premedication for Prophylaxis
- Corticosteroids

Pharmacotherapy PearlsTapering of corticosteroids after a short course of therapy (<7-10 days) is generally not required unless the disease/inflammatory process is slow to respond. Tapering after prolonged exposure is dependent upon the individual patient, duration of corticosteroid treatments, and size of steroid dose. Recovery of the HPA axis may require several months. Subtle but important HPA axis suppression may be present for as long as several months after a course of as few as 10-14 days duration. Testing of HPA axis (cosyntropin) may be required, and signs/symptoms of adrenal insufficiency should be monitored in patients with a history of use.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNervousness and insomnia are common; may rarely cause delirium, mood swings, euphoria, and hallucinations

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease corticosteroid effectiveness

Cardiovascular ConsiderationsLong-term steroid therapy is associated with fluid retention and hypertension. Glucocorticoid agents have some mineralocorticoid activity with consequent hemodynamic effects. Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. In discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia.

Oral and intravenous steroid therapy in patients with heart failure should be administered cautiously with special attention given to signs and symptoms of fluid retention.

Although glucocorticoids can provide relief from pericarditis postmyocardial infarctions, these drugs may cause thinning of the developing scar and myocardial rupture.

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Neuromuscular Effects: ICU-acquired paresis was recently studied in 5 ICUs (3 medical and 2 surgical ICUs) at 4 French hospitals. All ICU patients without pre-existing neuromuscular disease admitted from March 1999 through June 2000 were evaluated (De Jonghe, 2002). Each patient had to be mechanically ventilated for ≥7 days and was screened daily for awakening. The first day the patient was considered awake was Study Day 1. Patients with severe muscle weakness on Study Day 7 were considered to have ICU-acquired paresis. Among the 95 patients who were evaluated, about 25% developed ICU-acquired paresis. Independent predictors included female gender, the number of days with ≥2 organ dysfunction, and administration of corticosteroids. Further studies may be required to verify and characterize the association between the development of ICU-acquired paresis and use of corticosteroids. Concurrent use of a corticosteroid and muscle relaxant appears to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible.

Adrenal Insufficiency: Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. When discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia. Patients on long-term steroid supplementation will require higher corticosteroid doses when subject to stress (ie, trauma, surgery, severe infection). Guidelines for glucocorticoid replacement during various surgical procedures have been published (Coursin, 2002; Salem, 1994).

Index Terms Deltacortisone; Deltadehydrocortisone

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

U.S. Brand NamesLyrica®

Canadian Brand NamesLyrica®

Pharmacologic CategoryAnalgesic, Miscellaneous; Anticonvulsant, Miscellaneous

Use: Labeled IndicationsManagement of pain associated with diabetic peripheral neuropathy; management of postherpetic neuralgia; adjunctive therapy for partial-onset seizure disorder in adults; management of fibromyalgia

Dosing: Adults

Fibromyalgia: Oral: Initial: 150 mg/day in divided doses (75 mg 2 times/day); may be increased to 300 mg/day (150 mg 2 times/day) within 1 week based on tolerability and effect; may be further increased to 450 mg/day (225 mg 2 times/day). Maximum dose: 450 mg/day (dosages up to 600 mg/day were evaluated with no significant additional benefit and an increase in adverse effects)

Neuropathic pain (diabetes-associated): Oral: Initial: 150 mg/day in divided doses (50 mg 3 times/day); may be increased within 1 week based on tolerability and effect; maximum dose: 300 mg/day (dosages up to 600 mg/day were evaluated with no significant additional benefit and an increase in adverse effects)

Postherpetic neuralgia: Oral: Initial: 150 mg/day in divided doses (75 mg 2 times/day or 50 mg 3 times/day); may be increased to 300 mg/day within 1 week based on tolerability and effect; further titration (to 600 mg/day) after 2-4 weeks may be considered in patients who do not experience sufficient relief of pain provided they are able to tolerate pregabalin. Maximum dose: 600 mg/day

Partial onset seizures (adjunctive therapy): Oral: Initial: 150 mg per day in divided doses (75 mg 2 times/day or 50 mg 3 times/day); may be increased based on tolerability and effect (optimal titration schedule has not been defined). Maximum dose: 600 mg/day

Note: Discontinuing therapy: Pregabalin should not be abruptly discontinued; taper dosage over at least 1 week

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Pregabalin Renal Impairment Dosing

Cl_{cr} (mL/minute)	Total Pregabalin Daily Dose (mg/day)				Dosing Frequency
≥60	150	300	450	600	2-3 divided doses
30-60	75	150	225	300	2-3 divided doses
15-30	25-50	75	100-150	150	1-2 divided doses
<15	25	25-50	50-75	75	Single daily dose

Posthemodialysis supplementary dosage (as a single additional dose):

25 mg/day schedule: Single supplementary dose of 25 mg **or** 50 mg

25-50 mg/day schedule: Single supplementary dose of 50 mg **or** 75 mg

50-75 mg/day schedule: Single supplementary dose of 75 mg **or** 100 mg

75 mg/day schedule: Single supplementary dose of 100 mg **or** 150 mg

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food.
Dietary ConsiderationsMay be taken with or without food.
StorageStore at 15°C to 30°C (59°F to 86°F).
RestrictionsC-V
ContraindicationsHypersensitivity to pregabalin or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Angioedema: Angioedema has been reported; may be life-threatening; use with caution in patients with a history of angioedema episodes. Concurrent use with other drugs known to cause angioedema (eg, ACE inhibitors) may increase risk.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity: Hypersensitivity reactions, including skin redness, blistering, hives, rash, dyspnea, and wheezing have been reported; discontinue treatment of hypersensitivity occurs.
- Platelet count: May decrease platelet count .
- PR interval: May cause mild prolongation of PR interval. Clinical significance unknown, but use with caution in patients with underlying AV block.
- Rhabdomyolysis: Has been associated with increases in CPK and rare cases of rhabdomyolysis; patients should be instructed to notify their prescriber if unexplained muscle pain, tenderness, or weakness, particularly if fever and/or malaise are associated with these symptoms.
- Visual disturbances: Blurred vision, decreased acuity and visual field changes have been associated with therapy; patients should be instructed to notify their physician if these effects are noted.
- Weight gain: Use may be associated with weight gain and peripheral edema; effect on weight gain/edema may be additive to thiazolidinedione antidiabetic agent particularly in patients with prior cardiovascular disease.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with congestive heart failure, hypertension, or diabetes; weight gain and/or peripheral edema may occur.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Tumorigenic potential: Increased incidence of hemangiosarcoma noted in animal studies; significance of these findings in humans is unknown.
- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal. Tapering over at least 1 week is recommended.

Geriatric ConsiderationsIn clinical studies, no differences in safety and efficacy were noted between elderly. Since pregabalin is primarily excreted renally, dosage adjustment, based on Cl_{cr}, is necessary.
Pregnancy Risk FactorC
Pregnancy ConsiderationsIncreased incidence of fetal abnormalities, particularly skeletal malformations, were observed in animal studies. Male-mediated teratogenicity has been observed in animal studies; implications in humans are not defined. Impaired male and female fertility has been noted in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only when potential benefit to the mother outweighs possible risk to the fetus.
LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

Note: Frequency of adverse effects may be influenced by dose or concurrent therapy. In add-on trials in epilepsy, frequency of CNS and visual adverse effects were higher than those reported in pain management trials. Range noted below is inclusive of all trials.

>10%:

Cardiovascular: Peripheral edema (up to 16%)

Central nervous system: Dizziness (8% to 45%), somnolence (4% to 28%), ataxia (up to 20%), headache (up to 14%)

Gastrointestinal: Weight gain (up to 16%), xerostomia (1% to 15%)

Neuromuscular & skeletal: Tremor (up to 11%)

Ocular: Blurred vision (1% to 12%), diplopia (up to 12%)

Miscellaneous: Infection (up to 14%), accidental injury (2% to 11%)

1% to 10%:

Cardiovascular: Chest pain (up to 4%), edema (up to 6%)

Central nervous system: Neuropathy (up to 9%), thinking abnormal (up to 9%), fatigue (up to 8%), confusion (up to 7%), euphoria (up to 7%), speech disorder (up to 7%), attention disturbance (up to 6%), incoordination (up to 6%), amnesia (up to 6%), pain (up to 5%), memory impaired (up to 4%), vertigo (up to 4%), feeling abnormal (up to 3%), hypoesthesia (up to 3%), anxiety (up to 2%), depression (up to 2%), disorientation (up to 2%), lethargy (up to 2%), fever (≥1%), depersonalization (≥1%), hypertonia (≥1%), stupor (≥1%), nervousness (up to 1%)

Dermatologic: Facial edema (up to 3%), bruising (≥1%), pruritus (≥1%)

Endocrine & metabolic: Fluid retention (up to 3%), hypoglycemia (up to 3%), libido decreased (≥1%)

Gastrointestinal: Constipation (up to 10%), appetite increased (up to 7%), flatulence (up to 3%), vomiting (up to 3%), abdominal distension (up to 2%), abdominal pain (≥1%), gastroenteritis (≥1%)

Genitourinary: Incontinence (up to 2%), anorgasmia (≥1%), impotence (≥1%), urinary frequency (≥1%)

Hematologic: Thrombocytopenia (3%)

Neuromuscular & skeletal: Balance disorder (up to 9%), abnormal gait (up to 8%), weakness (up to 7%), arthralgia (up to 6%), twitching (up to 5%), back pain (up to 4%), muscle spasm (up to 4%), myoclonus (up to 4%), paresthesia (>2%), CPK increased (2%), leg cramps (≥1%), myalgia (≥1%), myasthenia (up to 1%)

Ocular: Visual abnormalities (up to 5%), visual field defect (≥2%), eye disorder (up to 2%), nystagmus (>2%), conjunctivitis (≥1%)

Otic: Otitis media (≥1%), tinnitus (≥1%)

Respiratory: Sinusitis (up to 7%), dyspnea (up to 3%), bronchitis (up to 3%), pharyngolaryngeal pain (up to 3%)

Miscellaneous: Flu-like syndrome (up to 2%), allergic reaction (≥1%)

<1% (Limited to important or life-threatening): Abscess, acute renal failure, addiction (rare), agitation, albuminuria, anaphylactoid reaction, anemia, angioedema, aphasia, aphthous stomatitis, apnea, ascites, atelectasis, blepharitis, blindness, bronchiolitis, cellulitis, cerebellar syndrome, cervicitis, chills, cholecystitis, cholelithiasis, chondrodystrophy, circumoral paresthesia, cogwheel rigidity, colitis, coma, corneal ulcer, crystalluria (urate), delirium, delusions, diarrhea, dysarthria, dysautonomia, dyskinesia, dysphagia, dystonia, dysuria, encephalopathy, eosinophilia, esophageal ulcer, esophagitis, exfoliative dermatitis, extraocular palsy, extrapyramidal syndrome, gastritis, GI hemorrhage, glomerulitis, glucose tolerance decreased, granuloma, Guillain-Barré syndrome, hallucinations, heart failure, hematuria, hostility, hyper-/hypokinesia; hypersensitivity (including skin redness, blistering, hives, rash, dyspnea, and wheezing); hypotension, hypotonia, intracranial hypertension, laryngismus, leukopenia, leukorrhea, leukocytosis, lymphadenopathy, manic reaction, melena, myelofibrosis, nausea, nephritis, neuralgia, ocular hemorrhage, oliguria, optic atrophy, pancreatitis, papilledema, paranoid reaction, pelvic pain, periodontal abscess, peripheral neuritis, polycythemia, postural hypotension, prothrombin decreased, psychotic depression, ptosis, pulmonary edema, pulmonary fibrosis, purpura, pyelonephritis, rectal hemorrhage, renal calculus, retinal edema, retinal vascular disorder, retroperitoneal fibrosis, rhabdomyolysis, schizophrenic reaction, shock, skin necrosis, skin ulcer, spasm (generalized), ST depression, Stevens-Johnson syndrome, subcutaneous nodule, suicide, suicide attempt, syncope, thrombocythemia, thrombophlebitis, tongue edema, torticollis, trismus, uveitis, ventricular fibrillation

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antidiabetic Agents (Thiazolidinedione): Pregabalin may enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersMeasures of efficacy (pain intensity/seizure frequency); degree of sedation; symptoms of myopathy or ocular disturbance; weight gain/edema; CPK; skin integrity (in patients with diabetes).

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. Monitor weight. Assess for signs of fluid retention. Taper dosage over at least one week when discontinuing. Do not discontinue abruptly. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsCPK

Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Avoid alcohol; may increase drowsiness/CNS depression. Taper dosage slowly when discontinuing. Do not discontinue abruptly. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake by prescriber. May cause CNS depression and/or dizziness (use caution when driving or engaging in activities requiring alertness until response to drug is known), headache, weight gain, or fluid retention. Report immediately any visual disturbances, suicidal ideation, or depression. Report unexplained muscle pain, tenderness, or weakness, especially if accompanied by unexplained fever and malaise, dizziness, confusion or abnormal thinking, shortness of breath, weight gain >5 lbs/week, swelling of extremities, problems with coordination, tremor, facial swelling, excessively dry mouth, and excessive drowsiness.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Lyrica®: 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg

Pricing: U.S. (www.drugstore.com)

Capsules (Lyrica)

25 mg (30): $72.44

50 mg (30): $73.49

75 mg (30): $72.44

100 mg (30): $73.49

150 mg (30): $73.49

200 mg (30): $73.49

225 mg (30): $73.49

300 mg (30): $73.49

Mechanism of ActionBinds to alpha$_2$-delta subunit of voltage-gated calcium channels within the CNS, inhibiting excitatory neurotransmitter release. Although structurally related to GABA, it does not bind to GABA or benzodiazepine receptors. Exerts antinociceptive and anticonvulsant activity. Decreases symptoms of painful peripheral neuropathies and, as adjunctive therapy in partial seizures, decreases the frequency of seizures.

Pharmacodynamics/Kinetics

Onset of action: Pain management: Effects may be noted as early as the first week of therapy.

Distribution: V_d: 0.5 L/kg

Protein binding: 0%

Metabolism: Negligible

Bioavailability: >90%

Half-life elimination: 6.3 hours

Time to peak, plasma: 1.5 hours (3 hours with food)

Excretion: Urine (90% as unchanged drug; minor metabolites)

U.S. Brand NamesCitanest® Forte Dental

Canadian Brand NamesCitanest® Forte

Pharmacologic CategoryLocal Anesthetic

Use: DentalAmide-type anesthetic used for local infiltration anesthesia; injection near nerve trunks to produce nerve block

Dosing: Adults

Dental anesthesia, infiltration, or conduction block:

Children >10 years and Adults: Initial: 40-80 mg (1-2 mL) of prilocaine hydrochloride as a 4% solution with epinephrine 1:200,000; up to a maximum of 400 mg (10 mL) of prilocaine hydrochloride within a 2-hour period. The effective anesthetic dose varies with procedure, intensity of anesthesia needed, duration of anesthesia required, and physical condition of the patient. Always use the lowest effective dose along with careful aspiration.

Note: Adult and children doses of prilocaine hydrochloride with epinephrine cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 140.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Dental anesthesia, infiltration, or conduction block:**

Children <10 years: Doses >40 mg (1 mL) of prilocaine hydrochloride as a 4% solution with epinephrine 1:200,000 are rarely needed.

Children >10 years: Refer to adult dosing.

Note: Adult and pediatric doses of prilocaine hydrochloride with epinephrine cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 140.

ContraindicationsHypersensitivity to local anesthetics of the amide-type or any component of the formulation

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.
- Methemoglobinemia: Has been reported with prilocaine.
- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest.
- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection.

Disease-related concerns:

- Cardiovascular disease: Should be used in minimal amounts in patients with significant cardiovascular problems (because of epinephrine component).
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hyperthyroidism: Should be avoided in patients with uncontrolled hyperthyroidism.

Special populations:

- Acutely ill patients: Use with caution in acutely ill; reduce dose consistent with age and physical status.
- Debilitated patients: Use with caution in debilitated patients; reduce dose consistent with age and physical status.
- Elderly: Use with caution in the elderly; reduce dose consistent with age and physical status.
- Pediatrics: Use with caution in children; reduce dose consistent with age and physical status.

Dosage form specific issues:

- Sodium metabisulfite: May contain sodium metabisulfite; use caution in patients with a sulfite allergy.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.

- Trained personnel: Dental practitioners using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC

Breast-Feeding ConsiderationsUsual infiltration doses of prilocaine with epinephrine given to nursing mothers has not been shown to affect the health of the nursing infant.

Adverse ReactionsDegree of adverse effects in the CNS and cardiovascular system are directly related to the blood levels of prilocaine. The effects below are more likely to occur after systemic administration rather than infiltration.

Cardiovascular: Myocardial effects include a decrease in contraction force as well as a decrease in electrical excitability and myocardial conduction rate resulting in bradycardia and reduction in cardiac output.

Central nervous system: High blood levels result in anxiety, restlessness, disorientation, confusion, dizziness, tremor and seizure. This is followed by depression of CNS resulting in somnolence, unconsciousness and possible respiratory arrest. Nausea and vomiting may also occur. In some cases, symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Hypersensitivity reactions: Extremely rare, but may be manifest as dermatologic reactions and edema at injection site. Asthmatic syndromes have occurred. Patients may exhibit hypersensitivity to bisulfites contained in local anesthetic solution to prevent oxidation of epinephrine. In general, patients reacting to bisulfites have a history of asthma and their airways are hyper-reactive to asthmatic syndrome.

Psychogenic reactions: It is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injections are perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitation, hyperventilation, generalized pallor, and a fainting feeling.

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Inhalational Anesthetics: May enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Citanest® Forte Dental: Prilocaine hydrochloride 4% and epinephrine bitartrate 1:200,000 (1.8 mL) [contains sodium metabisulfite; prefilled cartridge]

Generic AvailableNo

Mechanism of ActionLocal anesthetics bind selectively to the intracellular surface of sodium channels to block influx of sodium into the axon. As a result, depolarization necessary for action potential propagation and subsequent nerve function is prevented. The block at the sodium channel is reversible. When drug diffuses away from the axon, sodium channel function is restored and nerve propagation returns.

Epinephrine prolongs the duration of the anesthetic actions of prilocaine by causing vasoconstriction (alpha-adrenergic receptor agonist) of the vasculature surrounding the nerve axons. This prevents the diffusion of prilocaine away from the nerves resulting in a longer retention in the axon.

Pharmacodynamics/Kinetics

Onset of action: Infiltration: <2 minutes; Inferior alveolar nerve block: <3 minutes

Duration: Infiltration: 2.25 hours; Inferior alveolar nerve block: 3 hours

Dental Health: Effects on Dental TreatmentIt is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injections are perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitations, hyperventilation, generalized pallor and a fainting feeling. Patients may exhibit hypersensitivity to bisulfites contained in local anesthetic solution to prevent oxidation of epinephrine. In general, patients reacting to bisulfites have a history of asthma and their airways are hyper-reactive to asthmatic syndrome.

Degree of adverse effects in the CNS and cardiovascular system is directly related to blood levels of prilocaine (frequency not defined; more likely to occur after systemic administration rather than infiltration): Bradycardia and reduction in cardiac output, hypersensitivity reactions (extremely rare; may be manifest as dermatologic reactions and edema at injection site), asthmatic syndromes

High blood levels: Anxiety, restlessness, disorientation, confusion, dizziness, tremors, and seizures, followed by CNS depression, resulting in somnolence, unconsciousness and possible respiratory arrest; nausea and vomiting

In some cases, symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHigh blood levels result in anxiety, confusion, restlessness, disorientation, and dizziness. This is followed by CNS depression, resulting in somnolence, unconsciousness, and possible respiratory arrest. Symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Mental Health: Effects on Psychiatric TreatmentConcurrent use with propranolol or MAO inhibitors may produce severe hypertension.

Mental Health CommentIt is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction.

Medication Safety Issues

Sound-alike/look-alike issues:

Prilocaine may be confused with Polocaine®, Prilosec®

Pronunciation(PRIL oh kane)

U.S. Brand NamesCitanest® Plain Dental

Canadian Brand NamesCitanest® Plain

Pharmacologic CategoryLocal Anesthetic

Use: DentalAmide-type anesthetic used for local infiltration anesthesia; injection near nerve trunks to produce nerve block

Dosing: Adults

Dental anesthesia: Infiltration, or conduction block: Initial: 40-80 mg (1-2 mL) as a 4% solution; up to a maximum of 400 mg (10 mL) as a 4% solution within a 2-hour period. Manufacturer's maximum recommended dose is not more than 600 mg to normal healthy adults. The effective anesthetic dose varies with procedure, intensity of anesthesia needed, duration of anesthesia required and physical condition of the patient. Always use the lowest effective dose along with careful aspiration.

Note: Adult and children doses of prilocaine hydrochloride cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 139.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Dental anesthesia: Infiltration, or conduction block:

Children <10 years: Doses >40 mg (1 mL) as a 4% solution per procedure rarely needed

Children >10 years and Adults: Initial: 40-80 mg (1-2 mL) as a 4% solution; up to a maximum of 400 mg (10 mL) as a 4% solution within a 2-hour period. Manufacturer's maximum recommended dose is not more than 600 mg to normal healthy adults. The effective anesthetic dose varies with procedure, intensity of anesthesia needed, duration of anesthesia required and physical condition of the patient. Always use the lowest effective dose along with careful aspiration.

Note: Adult and children doses of prilocaine hydrochloride cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 139.

ContraindicationsHypersensitivity to local anesthetics of the amide type or any component of the formulation

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.
- Methemoglobinemia: Has been reported with prilocaine.
- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest.
- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Acutely ill patients: Use with caution in acutely ill; reduce dose consistent with age and physical status.
- Debilitated patients: Use with caution in debilitated patients; reduce dose consistent with age and physical status.

- Elderly: Use with caution in the elderly; reduce dose consistent with age and physical status.
- Pediatrics: Use with caution in children; reduce dose consistent with age and physical status.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.
- Trained personnel: Dental practitioners using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorB

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHigh blood levels result in anxiety, confusion, restlessness, disorientation, and dizziness. This is followed by CNS depression, resulting in somnolence, unconsciousness, and possible respiratory arrest. Symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Mental Health: Effects on Psychiatric TreatmentNone reported

Mental Health Comment

It is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction.

Anesthesia and Critical Care Concerns/Other Considerations Addition of sodium bicarbonate to local anesthetic solution can increase onset and potency. Only preservative-free solutions should be used for epidural administration. The metabolite *o*-toluidine can cause methemoglobinemia when large doses of prilocaine >600 mg are administered.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Primaquine may be confused with primidone

Pronunciation(PRIM a kween)

Pharmacologic CategoryAminoquinoline (Antimalarial)

Use: Labeled IndicationsPrevention of relapse of *P. vivax* malaria

Use: Unlabeled/InvestigationalPrevention of relapse of *P. ovale* malaria; treatment of *Pneumocystis jiroveci* pneumonia (PCP); prevention of chloroquine-resistant malaria

Dosing: Adults**Note:** The CDC recommends screening for G6PD deficiency prior to initiating treatment with primaquine. Dosage expressed as mg of base (15 mg base = 26.3 mg primaquine phosphate).

Relapse prevention of *P. vivax* malaria: CDC recommendations: Uncomplicated malaria (***P. vivax*** and ***P. ovale***): Oral: 30 mg once daily for 14 days; alternative regimen (recommended for mild G6PD deficiency): 45 mg once weekly for 8 weeks

Prevention of chloroquine-resistant malaria (unlabeled use; CDC guidelines): Oral: Initiate 1-2 days prior to travel and continue for 7 days after departure from malaria-endemic area: 30 mg once daily

***Pneumocystis jiroveci*pneumonia treatment (unlabeled use):** Oral: CDC recommendation (as alternative): 30 mg once daily for 21 days (in combination with clindamycin)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** The CDC recommends screening for G6PD deficiency prior to initiating treatment with primaquine. Dosage expressed as mg of base (15 mg base = 26.3 mg primaquine phosphate).

Relapse prevention of *P. vivax* malaria: CDC recommendations: Uncomplicated malaria (***P. vivax*** and ***P. ovale***): Oral: 0.5 mg/kg once daily for 14 days (maximum dose: 30 mg/day); alternative regimen (recommended for mild G6PD deficiency): 45 mg once weekly for 8 weeks

Prevention of chloroquine-resistant malaria (unlabeled use; CDC guidelines): Oral: Initiate 1-2 days prior to travel and continue for 7 days after departure from malaria-endemic area: 0.5 mg/kg once daily

***Pneumocystis jiroveci*pneumonia treatment (unlabeled use):** Oral: CDC recommendation (as alternative): 0.3 mg/kg once daily for 21 days (in combination with clindamycin)

Administration: OralTake with meals to decrease adverse GI effects. Drug has a bitter taste.

ContraindicationsUse in acutely-ill patients who have a tendency to develop granulocytopenia (eg, rheumatoid arthritis, SLE); concurrent use with other medications causing hemolytic anemia or myeloid bone marrow suppression; concurrent use with or recent use of quinacrine

Allergy Considerations

- QuiNIDine/QuiNINE Derivative Allergy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Hemolytic anemia: Promptly discontinue with signs of hemolytic anemia (darkening of urine, marked fall in hemoglobin or erythrocyte count). Moderate-to-severe hemolytic reactions may occur in individuals with glucose-6-phosphate dehydrogenase (G6PD) deficiency and personal or familial history of favism. Geographic regions with a high prevalence of G6PD deficiency (eg, Africa, southern Europe, Mediterranean region, Middle East, southeast Asia, Oceania) are associated with a higher incidence of hemolytic anemia.

- Other hematologic effects: Anemia, methemoglobinemia, and leukopenia have been associated with primaquine use; monitor during treatment; do not exceed recommended dosage and duration.

Disease-related concerns:

- G6PD deficiency: Use with caution in patients with known G6PD; use of aminoquinolines has been associated with hemolysis. The CDC recommends screening for G6PD deficiency prior to therapy initiation.

- NADH methemoglobin reductase deficiency: Use with caution in patients with NADH methemoglobin reductase deficiency; methemoglobinemia may occur.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be prescribed by physicians familiar with its use.**

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias (rare)

Central nervous system: Headache

Dermatologic: Pruritus

Gastrointestinal: Abdominal cramps, dyspepsia, nausea, vomiting

Hematologic: Agranulocytosis, anemia, hemolytic anemia (in patients with G6PD deficiency), leukopenia, leukocytosis, methemoglobinemia (in NADH-methemoglobin reductase-deficient individuals)

Ocular: Interference with visual accommodation

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (strong), 2D6 (weak), 3A4 (weak); **Induces** CYP1A2 (weak)

Drug Interactions

Anthelmintics: Aminoquinolines (Antimalarial) may decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): Antimalarial Agents may increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Beta-Blockers: Aminoquinolines (Antimalarial) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoquinolines (Antimalarial) may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Mefloquine: Aminoquinolines (Antimalarial) may enhance the adverse/toxic effect of Mefloquine. Specifically, the risk for QTc-prolongation and the risk for convulsions may be increased. Mefloquine may increase the serum concentration of Aminoquinolines (Antimalarial). Management: Avoid concurrent use, and delay administration of mefloquine until at least 12 hours after the last dose of an aminoquinoline antimalarial when possible. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).

Monitoring ParametersPeriodic CBC, visual color check of urine, glucose, electrolytes; if hemolysis suspected, monitor CBC, haptoglobin, peripheral smear, urinalysis dipstick for occult blood, G6PD deficiency screening (prior to initiating treatment; CDC recommendation)

Nursing: Physical Assessment/MonitoringScreen for G6PD deficiency prior to beginning therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity. Evaluate results of laboratory tests, therapeutic effects (according to purpose for use), and adverse reactions (eg, arrhythmias, pruritus, gastrointestinal upset, hematological changes) on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration and periodic ophthalmic examinations with long-term therapy), and adverse symptoms to report.

Monitoring: Lab TestsPeriodic CBC, visual color check of urine, glucose, electrolytes; if hemolysis suspected - CBC, haptoglobin, peripheral smear, urinalysis dipstick for occult blood, G6PD deficiency screening (prior to initiating treatment; CDC recommendation)

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. It is important to complete full course of therapy for full effect. May be taken with meals to decrease GI upset and bitter aftertaste. Avoid excessive alcohol intake. You should have regular ophthalmic exams (every 4-6 months) if using this medication over extended periods. May cause nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report persistent GI disturbance, chest pain or palpitation, unusual fatigue, easy bruising or bleeding, visual or hearing disturbances, changes in urine (darkening, tinged with red, decreased volume), or any other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as phosphate: 26.3 mg [15 mg base]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Primaquine Phosphate)

26.3 mg (14): $25.99

Mechanism of ActionEliminates the primary tissue exoerythrocytic forms of *P. falciparum*; disrupts mitochondria and binds to DNA

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Metabolism: Hepatic to carboxyprimaquine (active)

Half-life elimination: 3.7-9.6 hours

Time to peak, serum: 1-2 hours

Excretion: Urine (small amounts as unchanged drug)

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

Primidone may be confused with predniSONE, primaquine

Pronunciation(PRI mi done)

U.S. Brand NamesMysoline®

Canadian Brand NamesApo-Primidone®

Pharmacologic CategoryAnticonvulsant, Miscellaneous; Barbiturate

Use: Labeled IndicationsManagement of grand mal, psychomotor, and focal seizures

Use: Unlabeled/InvestigationalBenign familial tremor (essential tremor)

Dosing: Adults

Essential tremor (unlabeled use): 750 mg early in divided doses

Seizure disorders (grand mal, psychomotor, and focal): Oral: Initial: 125-250 mg/day at bedtime; increase by 125-250 mg/day every 3-7 days; usual dose: 750-1500 mg/day in divided doses 3-4 times/day with maximum dosage of 2 g/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSeizure disorders (grand mal, psychomotor, and focal): Oral:

Children <8 years: Initial: 50-125 mg/day given at bedtime; increase by 50-125 mg/day increments every 3-7 days; usual dose: 10-25 mg/kg/day in divided doses 3-4 times/day.

Children ≥8 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 50-80 mL/minute: Administer every 8 hours.

Cl_{cr} 10-50 mL/minute: Administer every 8-12 hours.

Cl_{cr} <10 mL/minute: Administer every 12-24 hours.

Moderately dialyzable (20% to 50%)

Administer dose postdialysis or administer supplemental 30% dose.

Dosing: Hepatic ImpairmentIncreased side effects may occur in severe liver disease. Monitor plasma levels and adjust dose accordingly.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Dietary ConsiderationsFolic acid: Low erythrocyte and CSF folate concentrations. Megaloblastic anemia has been reported. To avoid folic acid deficiency and megaloblastic anemia, some clinicians recommend giving patients on anticonvulsants prophylactic doses of folic acid and cyanocobalamin.

StorageProtect from light.

ContraindicationsHypersensitivity to primidone, phenobarbital, or any component of the formulation; porphyria; pregnancy

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Depression: Use with caution in patients with depression or suicidal tendencies.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hypoadrenalism: Use with caution in patients with hypoadrenalism.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.
- Substance abuse: Use with caution in patients with a history of drug abuse; potential for drug dependency exists. Tolerance or psychological and physical dependence may occur with prolonged use.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in patients who are debilitated; may cause paradoxical responses.
- Elderly: Use with caution in the elderly; may cause paradoxical responses.
- Pediatrics: Use with caution in children; may cause paradoxical responses. Primidone's metabolite, phenobarbital, has been associated with cognitive deficits in children.

Other warnings/precautions:

- Acute pain: Do not administer to patients in acute pain.
- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsDue to CNS effects, monitor closely when initiating drug in elderly. Monitor CBC at 6-month intervals to compare with baseline obtained at start of therapy. Since elderly metabolize phenobarbital at a slower rate than younger adults, it is suggested to measure both primidone and phenobarbital serum concentrations together. Adjust dose for renal function in elderly when initiating or changing dose.

Pregnancy Risk FactorD

Pregnancy ConsiderationsCrosses the placenta. Dysmorphic facial features; hemorrhagic disease of newborn due to fetal vitamin K depletion, maternal folic acid deficiency may occur. Epilepsy itself, number of medications, genetic factors, or a combination of these probably influence the teratogenicity of anticonvulsant therapy. Benefit:risk ratio usually favors continued use during pregnancy.

LactationEnters breast milk/not recommended (AAP recommends use "with caution")

Breast-Feeding ConsiderationsSedation and feeding problems may occur in nursing infants. AAP recommends USE WITH CAUTION.

Adverse ReactionsFrequency not defined.

Central nervous system: Drowsiness, vertigo, ataxia, lethargy, behavior change, fatigue, hyperirritability

Dermatologic: Rash

Gastrointestinal: Nausea, vomiting, anorexia

Genitourinary: Impotence

Hematologic: Agranulocytopenia, agranulocytosis, anemia

Ocular: Diplopia, nystagmus

Metabolism/Transport EffectsMetabolized to phenobarbital; **Induces** CYP1A2 (strong), 2B6 (strong), 2C8 (strong), 2C9 (strong), 3A4 (strong)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Barbiturates: Primidone may enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Primidone. Specifically, osteomalacia and rickets. Carbonic Anhydrase Inhibitors may decrease the serum concentration of Primidone. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Primidone may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Primidone. Specifically, the concentration of its metabolite, phenobarbital. *Risk C: Monitor therapy*

Folic Acid: May decrease the serum concentration of Primidone. Additionally, folic acid may decrease concentrations of active metabolites of primidone (e.g., phenobarbital). *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

LamoTRIgine: Primidone may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Leucovorin-Levoleucovorin: May decrease the serum concentration of Primidone. Additionally, leucovorin/levoleucovorin may decrease concentrations of active metabolites of primidone (e.g., phenobarbital). *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Methylfolate: May decrease the serum concentration of Primidone. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Phenytoin: May increase the metabolism of Primidone. The ratio of primidone:phenobarbital is thus changed. *Risk C: Monitor therapy*

QuiNIDine: Primidone may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rufinamide: Primidone may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Primidone. More specifically, the metabolism of phenobarbital, primidone's primary active metabolite, would be decreased. Primidone may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Protein-deficient diets increase duration of action of primidone.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersSerum primidone and phenobarbital concentration, CBC, neurological status. Due to CNS effects, monitor closely when initiating drug in elderly. Monitor CBC at 6-month intervals to compare with baseline obtained at start of therapy. Since elderly metabolize phenobarbital at a slower rate than younger adults, it is suggested to measure both primidone and phenobarbital levels together.

Reference RangeTherapeutic: Children <5 years: 7-10 mcg/mL (SI: 32-46 µmol/L); Adults: 5-12 mcg/mL (SI: 23-55 µmol/L); toxic effects rarely present with levels <10 mcg/mL (SI: 46 µmol/L) if phenobarbital concentrations are low. Dosage of primidone is adjusted with reference mostly to the phenobarbital level; Toxic: >15 mcg/mL (SI: >69 µmol/L)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use and seizure precautions, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsSerum primidone and phenobarbital concentration, CBC. Monitor CBC at 6-month intervals to compare with baseline obtained at start of therapy. Since elderly patients metabolize phenobarbital at a slower rate than younger adults, it is suggested to measure both primidone and phenobarbital levels together.

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day

of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or impotence (reversible). Wear identification of epileptic status and medications. Report behavioral or CNS changes (confusion, depression, increased sedation, excitation, headache, insomnia, or lethargy); muscle weakness, or tremors; unusual bruising or bleeding (mouth, urine, stool); or worsening of seizure activity or loss of seizure control. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this drug; use appropriate contraceptive measures. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 50 mg, 250 mg [generic tablet may contain sodium benzoate]

Dosage forms available in Canada: Tablet: 125 mg, 250 mg. **Note:** 50 mg tablet is **not** available in Canada.

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Mysoline)

50 mg (90): $158.99

250 mg (30): $132.98

Tablets (Primidone)

250 mg (90): $69.99

Mechanism of ActionDecreases neuron excitability, raises seizure threshold similar to phenobarbital; primidone has two active metabolites, phenobarbital and phenylethylmalonamide (PEMA); PEMA may enhance the activity of phenobarbital
Pharmacodynamics/Kinetics

Absorption: 60% to 80%

Distribution: Adults: V_d: 0.6 L/kg

Protein binding: 30%

Metabolism: Hepatic to phenobarbital (active) by oxidation and to phenylethylmalonamide (PEMA; active) by scission of the heterocyclic ring

Half-life elimination (age dependent): Primidone: Mean: 5-15 hours (variable); PEMA: 16 hours (variable)

Time to peak, serum: ~3 hours (variable)

Excretion: Urine (40% as unchanged drug; the remainder is unconjugated PEMA, phenobarbital and its metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Index TermsDesoxyphenobarbital; Primaclone

Probenecid

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Probenecid may be confused with Procanbid®

Pronunciation(proe BEN e sid)

Canadian Brand NamesBenuryl™

Pharmacologic CategoryUricosuric Agent

Use: Labeled IndicationsPrevention of hyperuricemia associated with gout or gouty arthritis; prolongation and elevation of beta-lactam plasma levels

Dosing: Adults

Hyperuricemia with gout: Oral: 250 mg twice daily for 1 week; increase to 250-500 mg/day; may increase by 500 mg/month, if needed, to maximum of 2-3 g/day (dosages may be increased by 500 mg every 6 months if serum urate concentrations are controlled)

Prolong penicillin serum levels: Oral: 500 mg 4 times/day

Gonorrhea: CDC guidelines (alternative regimen): Probenecid 1 g orally with cefoxitin 2 g I.M.

Pelvic inflammatory disease: CDC guidelines: Cefoxitin 2 g I.M. plus probenecid 1 g orally as a single dose

Neurosyphilis: CDC guidelines (alternative regimen): Procaine penicillin 2.4 million units/day I.M. plus probenecid 500 mg orally 4 times/day; both administered for 10-14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Note: Contraindicated in children <2 years of age.

Prolong penicillin serum levels: Oral: Children 2-14 years: Initial: 25 mg/kg, then 40 mg/kg/day given 4 times/day (maximum: 500 mg/dose)

Treatment of gonorrhea: >45 kg: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Avoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Dietary ConsiderationsDrug may cause GI upset; take with food if GI upset. Drink plenty of fluids.

ContraindicationsHypersensitivity to probenecid or any component of the formulation; high-dose aspirin therapy; blood dyscrasias; uric acid kidney stones; children <2 years of age

Warnings/Precautions

Concerns related to adverse effects:

- Gout: May cause exacerbation of acute gouty attack.

Disease-related concerns:

- Peptic ulcer disease: Use with caution in patients with peptic ulcer disease.

- Renal impairment: Monotherapy may not be effective in patients with a creatinine clearance <30 mL/minute.

Concurrent drug therapy issues:

- Penicillin: Use of probenecid with penicillin in patients with renal insufficiency is not recommended.

- Salicylates: Salicylates may diminish the therapeutic effect of probenecid; this effect may be more pronounced with high, chronic doses, however, the manufacturer recommends the use of an alternative analgesic even in place of small doses of aspirin.

Geriatric ConsiderationsSince probenecid loses its effectiveness when the Cl_{cr} is <30 mL/minute, its usefulness in the elderly is limited.

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Cardiovascular: Flushing

Central nervous system: Dizziness, fever, headache

Dermatologic: Alopecia, dermatitis, pruritus, rash

Gastrointestinal: Anorexia, nausea, sore gums, vomiting

Genitourinary: Hematuria, polyuria

Hematologic: Anemia, aplastic anemia, hemolytic anemia, leukopenia

Hepatic: Hepatic necrosis

Neuromuscular & skeletal: Costovertebral pain, gouty arthritis (acute)

Renal: Nephrotic syndrome, renal colic

Miscellaneous: Anaphylaxis, hypersensitivity

Metabolism/Transport Effects**Inhibits** CYP2C19 (weak)

Drug Interactions

Carbapenems: Uricosuric Agents may decrease the excretion of Carbapenems. Management: Avoid concomitant use of doripenem and probenecid. *Risk C: Monitor therapy*

Cephalosporins: Uricosuric Agents may decrease the excretion of Cephalosporins. **Exceptions:** Ceftobiprole. *Risk C: Monitor therapy*

Dapsone: Uricosuric Agents may decrease the excretion of Dapsone. *Risk C: Monitor therapy*

Doripenem: Probenecid may increase the serum concentration of Doripenem. This effect is due to probenecid's ability to decrease the active tubular secretion of doripenem. *Risk D: Consider therapy modification*

Gemifloxacin: Probenecid may decrease the excretion of Gemifloxacin. *Risk C: Monitor therapy*

Ketoprofen: Probenecid may increase the serum concentration of Ketoprofen. *Risk C: Monitor therapy*

Ketorolac: Probenecid may increase the serum concentration of Ketorolac. *Risk X: Avoid combination*

LORazepam: Probenecid may decrease the metabolism of LORazepam. *Risk D: Consider therapy modification*

Methotrexate: Uricosuric Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Mycophenolate: Probenecid may increase the serum concentration of Mycophenolate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: Probenecid may increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Penicillins: Uricosuric Agents may decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Quinolone Antibiotics: Probenecid may increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: May diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Sodium Benzoate: Probenecid may increase the serum concentration of Sodium Benzoate. Specifically, probenecid may inhibit the renal transport of the hippuric acid metabolite of sodium benzoate. *Risk C: Monitor therapy*

Sodium Phenylacetate: Probenecid may increase the serum concentration of Sodium Phenylacetate. Specifically, probenecid may inhibit the renal transport of the phenylacetylglutamine metabolite of sodium phenylacetate. *Risk C: Monitor therapy*

Theophylline Derivatives: Uricosuric Agents may decrease the excretion of Theophylline Derivatives. **Exceptions:** Aminophylline; Theophylline. *Risk C: Monitor therapy*

Zidovudine: Probenecid may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Test InteractionsFalse-positive glucosuria with Clinitest®, a falsely high determination of theophylline has occurred and the renal excretion of phenolsulfonphthalein 17-ketosteroids and bromsulfophthalein (BSP) may be inhibited

Monitoring ParametersUric acid, renal function, CBC

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsUric acid, renal function, CBC

Patient EducationTake as directed; do not discontinue without consulting prescriber. May take 6-12 months to reduce gouty attacks (attacks may increase in frequency and severity for first few months of therapy). Take with food or antacids or alkaline ash foods (milk, nuts, beets, spinach, turnip greens). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid aspirin or aspirin-containing substances. If you have diabetes, use serum glucose monitoring. If you experience severe headache, contact prescriber for medication. You may experience dizziness or lightheadedness (use caution when driving, changing position, or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, indigestion, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report skin rash or itching, persistent headache, blood in urine or painful urination, excessive tiredness or easy bruising or bleeding, or sore gums. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 500 mg

Generic Available Yes

Pricing: U.S. (www.drugstore.com)

Tablets (Probenecid)

500 mg (60): $34.99

Mechanism of Action Competitively inhibits the reabsorption of uric acid at the proximal convoluted tubule, thereby promoting its excretion and reducing serum uric acid levels; increases plasma levels of weak organic acids (penicillins, cephalosporins, or other beta-lactam antibiotics) by competitively inhibiting their renal tubular secretion

Pharmacodynamics/Kinetics

Onset of action: Effect on penicillin levels: 2 hours

Absorption: Rapid and complete

Metabolism: Hepatic

Half-life elimination (dose dependent): Normal renal function: 6-12 hours

Time to peak, serum: 2-4 hours

Excretion: Urine

Related Information

- Treatment of Sexually-Transmitted Infections

Pharmacotherapy Pearls Avoid fluctuation in uric acid (increase or decrease); may precipitate gout attack. Use of sodium bicarbonate or potassium citrate is suggested until serum uric acid normalizes and tophaceous deposits disappear.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Sore gums.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness

Mental Health: Effects on Psychiatric Treatment May rarely cause leukopenia; use caution with clozapine and carbamazepine

Index Terms Benemid [DSC]

Probucol

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(PROE byoo kole)
Canadian Brand NamesLorelco速
Pharmacologic CategoryAntilipemic Agent, Miscellaneous
Use: Labeled IndicationsAdjunct to dietary therapy to decrease elevated serum total and LDL-cholesterol concentrations in primary hypercholesterolemia
Dosing: Adults**Dyslipidemia:** Oral: 500 mg twice daily administered with the morning and evening meals
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Dyslipidemia:** Oral: Children:

<27 kg: 250 mg twice daily with meals

>27 kg: 500 mg twice daily with meals

RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to probucol or any component of the formulation; ventricular arrhythmias
Pregnancy Risk FactorB
Adverse ReactionsFrequency not defined.

Cardiovascular: QT prolongation, serious arrhythmia

Central nervous system: Dizziness, headache, numbness of extremities

Gastrointestinal: Bloating, diarrhea, stomach pain, nausea, vomiting

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CycloSPORINE: Probucol may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 250 mg, 500 mg [not available in the U.S.]

Generic AvailableNo
Mechanism of ActionIncreases the fecal loss of bile acid-bound low density lipoprotein cholesterol, decreases the synthesis of cholesterol and inhibits enteral cholesterol absorption
Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsProbucol is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine速 2% with Neo-Cobefrin速]) be used with caution.
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentConcurrent use with phenothiazines, TCAs, or beta-blockers may produce AV block

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Procanbid® may be confused with probenecid

Pronestyl® may be confused with Ponstel®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

PCA is an error-prone abbreviation (mistaken as patient controlled analgesia)

Pronunciation(pro KANE a mide)

U.S. Brand NamesProcanbid® [DSC]

Canadian Brand NamesApo-Procainamide®; Procainamide Hydrochloride Injection, USP ; Procan® SR; Pronestyl®-SR

Pharmacologic CategoryAntiarrhythmic Agent, Class Ia

Use: Labeled IndicationsTreatment of ventricular tachycardia (VT), premature ventricular contractions, paroxysmal atrial tachycardia (PSVT), and atrial fibrillation (AF); prevent recurrence of ventricular tachycardia, paroxysmal supraventricular tachycardia, atrial fibrillation or flutter

Use: Unlabeled/Investigational

ACLS guidelines:

Stable monomorphic VT (EF >40%, no CHF)

Stable wide complex tachycardia, likely VT (EF >40%, no CHF, patient stable)

Atrial fibrillation or flutter, including pre-excitation syndrome (EF >40%, no CHF)

AV reentrant, narrow complex tachycardia (eg, reentrant SVT) [preserved ventricular function]

PALS guidelines: Tachycardia with pulses and poor perfusion (possible VT)

Dosing: AdultsDose must be titrated to patient's response.

Antiarrhythmic:

Oral: Usual dose: 50 mg/kg/24 hours: maximum: 5 g/24 hours (**Note:** Twice-daily dosing approved for Procanbid®.)

Immediate release formulation: 250-500 mg/dose every 3-6 hours

Extended release formulation: 500 mg to 1 g every 6 hours; Procanbid®: 1000-2500 mg every 12 hours

I.M.: 0.5-1 g every 4-8 hours until oral therapy is possible

I.V. (infusion requires use of an infusion pump):

Loading dose: 15-18 mg/kg administered as slow infusion over 25-30 minutes **or** 100-200 mg/dose repeated every 5 minutes as needed to a total dose of 1 g. Reduce loading dose to 12 mg/kg in severe renal or cardiac impairment.

Maintenance dose: 1-4 mg/minute by continuous infusion. Maintenance infusions should be reduced by one-third in patients with moderate renal or cardiac impairment and by two-thirds in patients with severe renal or cardiac impairment.

ACLS guidelines: Infuse 20 mg/minute until arrhythmia is controlled, hypotension occurs, QRS complex widens by 50% of its original width, or total of 17 mg/kg is given.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricMust be titrated to patient's response:

Arrhythmias:

Oral: 15-50 mg/kg/24 hours divided every 3-6 hours

I.M.: 50 mg/kg/24 hours divided into doses of $^1/_8$ to $^1/_4$ every 3-6 hours in divided doses until oral therapy is possible

I.V. (infusion requires use of an infusion pump):

Load: 3-6 mg/kg/dose over 5 minutes not to exceed 100 mg/dose; may repeat every 5-10 minutes to maximum of 15 mg/kg/load

Maintenance as continuous I.V. infusion: 20-80 mcg/kg/minute; maximum: 2 g/24 hours

Possible VT (pulses and poor perfusion) [PALS 2005 Guidelines]: I.V.; I.O.: 15 mg/kg over 30-60 minutes

Dosing: Renal Impairment

Oral:

Cl_{cr} 10-50 mL/minute: Administer every 6-12 hours.

Cl_{cr} <10 mL/minute: Administer every 8-24 hours.

I.V.:

Loading dose: Reduce dose to 12 mg/kg in severe renal impairment.

Maintenance infusion: Reduce dose by one-third in patients with mild renal impairment. Reduce dose by two-thirds in patients with severe renal impairment.

Dialysis:

Procainamide: Moderately hemodialyzable (20% to 50%): 200 mg supplemental dose posthemodialysis is recommended.

N-acetylprocainamide: Not dialyzable (0% to 5%)

Procainamide/N-acetylprocainamide: Not peritoneal dialyzable (0% to 5%)

Procainamide/N-acetylprocainamide: Replace by blood level during continuous arteriovenous or venovenous hemofiltration

Dosing: Hepatic ImpairmentReduce dose by 50%.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Procainamide

Administration: I.V.Must dilute prior to I.V. administration; maximum rate: 50 mg/minute; give around-the-clock to promote less variation in peak and trough serum levels.

Infusion rate: **2 g/250 mL** (I.V. infusion requires use of an infusion pump):

1 mg/minute: 7.5 mL/hour

2 mg/minute: 15 mL/hour

3 mg/minute: 22.5 mL/hour

4 mg/minute: 30 mL/hour

5 mg/minute: 37.5 mL/hour

6 mg/minute: 45 mL/hour

Administration: I.V. DetailpH: 4-6

Administration: OralDo **not** crush or chew extended release drug products.

Dietary ConsiderationsShould be taken with water on an empty stomach.

StorageProcainamide may be stored at room temperature up to 27°C; however, refrigeration retards oxidation, which causes color formation. The solution is initially colorless but may turn slightly yellow on standing. Injection of air into the vial causes the solution to darken. Solutions darker than a light amber should be discarded. Stability of admixture at room temperature in D_5W or NS: 24 hours.

ReconstitutionMinimum volume: 1 g/250 mL NS/D_5W .

Some information indicates that procainamide may be subject to greater decomposition in D_5W unless the admixture is refrigerated or the pH is adjusted. Procainamide is believed to form an association complex with dextrose - the bioavailability of procainamide in this complex is not known and the complex formation is reversible.

CompatibilityStable in $^1/_2$NS, NS, sterile water for injection; **variable stability (consult detailed reference)** in D_5NS, D_5W.

Y-site administration: Compatible: Amiodarone, cisatracurium, famotidine, heparin, hydrocortisone sodium succinate, potassium chloride, ranitidine, remifentanil, vitamin B complex with C. **Incompatible** Milrinone. **Variable (consult detailed reference):** Diltiazem, inamrinone.

Compatibility when admixed: Compatible: Amiodarone, atracurium, dobutamine, flumazenil, lidocaine, verapamil. **Incompatible:** Esmolol, ethacrynate, milrinone, phenytoin. **Variable (consult detailed reference):** Bretylium.

Extemporaneously Prepared**Note:** Several formulations have been described, some being more complex; for all formulations, the pH must be 4-6 to prevent degradation; some preparations require adjustment of pH; shake well before use

A suspension of 50 mg/mL can be made with the capsules, distilled water, and a 2:1 simple syrup/cherry syrup mixture; stability 2 weeks under refrigeration (ASHP, 1987)

Concentrations of 5, 50, and 100 mg/mL oral liquid preparations (made with the capsules, sterile water for irrigation and cherry syrup) stored at 4°C to 6°C (pH 6) were stable for at least 6 months (Metras, 1992).

A sucrose-based syrup (procainamide 50 mg/mL) made with capsules, distilled water, simple syrup, parabens, and cherry flavoring had a calculated stability of 456 days at 25°C and measured stability of 42 days at 40°C (pH ~5) while a maltitol-based syrup (procainamide 50 mg/mL) made with capsules, distilled water, Lycasin® (a syrup vehicle with 75% w/w maltitol), parabens, sodium bisulfate, saccharin, sodium acetate, pineapple and apricot flavoring, FD & C yellow number 6 (pH adjusted to 5 with glacial acetic acid) had a calculated stability of 97 days at 25°C and a measured stability of 94 days at 40°C. The maltitol-based syrup was more stable than the sucrose-based syrup when temperature was >37°C, but the sucrose-based syrup was more stable at temperatures <37°C (Alexander, 1993).

Alexander KS, Pudipeddi M, and Parker GA, “Stability of Procainamide Hydrochloride Syrups Compounded From Capsules,” *Am J Hosp Pharm*, 1993, 50(4):693-8.

Contraindications

Hypersensitivity to procaine, other ester-type local anesthetics, or any component of the formulation; complete heart block (except in patients with a functioning artificial pacemaker); second-degree AV block (without a functional pacemaker); various types of hemiblock (without a functional pacemaker); SLE; torsade de pointes; concurrent cisapride use; QT prolongation

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Boxed warnings:

- Blood dyscrasias: See “Other warnings/precautions” below.
- CAST trial: See “Other warnings/precautions” below.
- Drug-induced lupus erythematosus-like syndrome: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Blood dyscrasias: **[U.S. Boxed Warning]: Potentially fatal blood dyscrasias have occurred with therapeutic doses;** close monitoring is recommended during the first 3 months of therapy.
- Conduction disturbances: Reduce dose if first-degree heart block occurs.
- Drug-induced lupus erythematosus-like syndrome: **[U.S. Boxed Warning]: Long-term administration leads to the development of a positive antinuclear antibody (ANA) test in 50% of patients which may result in a drug-induced lupus erythematosus-like syndrome (in 20% to 30% of patients);** discontinue procainamide with SLE symptoms and choose an alternative agent.
- Hypersensitivity reaction: With use, hypersensitivity reactions can occur.
- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation.

Disease-related concerns:

- Atrial fibrillation/flutter: May increase ventricular response rate in patients with atrial fibrillation or flutter; control AV conduction before initiating.
- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.
- Heart failure (HF): Use with caution in patients with HF; may precipitate or exacerbate condition.
- Myasthenia gravis: Avoid use in myasthenia gravis; may worsen condition.
- Renal impairment: Use with caution in patients with renal impairment; dosage reduction recommended.

Concurrent drug therapy issues:

- Antiarrhythmics: Use caution with concurrent use of other antiarrhythmics.

Dosage form specific issues:

- Bisulfite: Injection may contain bisulfite (allergens).
- Tartrazine: Some tablets contain tartrazine.

Other warnings/precautions:

- CAST trial: **[U.S. Boxed Warning] In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide.** An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

Geriatric ConsiderationsMonitor closely since clearance is reduced in those >60 years of age. If clinically possible, start doses at lowest recommended dose. Also, elderly frequently have drug therapy which may interfere with the use of procainamide. Adjust dose for renal function in the elderly.

Pregnancy Risk FactorC

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsConsidered compatible by the AAP. However, the AAP stated concern regarding long-term effects and potential for infant toxicity. Use caution and monitor closely if continuing to breast-feed while taking procainamide.

Adverse Reactions

>1%:

Cardiovascular: Hypotension (I.V. up to 5%)

Dermatologic: Rash

Gastrointestinal: Diarrhea (3% to 4%), nausea, vomiting, taste disorder, GI complaints (3% to 4%)

<1% (Limited to important or life-threatening): New or worsened arrhythmia (proarrhythmic effect), tachycardia, QT prolongation (excessive), second-degree heart block, torsade de pointes, ventricular arrhythmia, depressed myocardial contractility, paradoxical increase in ventricular rate in atrial fibrillation/flutter, dizziness, lightheadedness, confusion, hallucinations, mental depression, disorientation, fever, drug fever, rash, urticaria, pruritus, angioneurotic edema, flushing, maculopapular rash, hemolytic anemia, agranulocytosis, neutropenia, thrombocytopenia (0.5%), positive Coombs' test, bone marrow suppression, hypoplastic anemia, leukopenia, pancytopenia, aplastic anemia, transaminases increased, alkaline phosphatase increased, hyperbilirubinemia, hepatic failure,granulomatous hepatitis, intrahepatic cholestasis, arthralgia, myalgia (<0.5%), worsening of myasthenia gravis, neuromuscular blockade, weakness, peripheral/polyneuropathy, myopathy, pleural effusion, SLE-like syndrome (increased incidence with long-term therapy and includes abdominal pain, arthralgia, pleural effusion, pericarditis, fever, chills, myalgia, rash); positive ANA

Postmarketing and/or case reports: Pancreatitis, pseudo-obstruction, tremor, mania, myocarditis, vasculitis, psychosis, cerebellar ataxia, demyelinating polyradiculoneuropathy, respiratory failure due to myopathy, pulmonary embolism, myopathy

Metabolism/Transport Effects**Substrate** of CYP2D6 (major)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amiodarone: Antiarrhythmic Agents (Class Ia) may enhance the QTc-prolonging effect of Amiodarone. Amiodarone may increase the metabolism of Antiarrhythmic Agents (Class Ia). *Risk D: Consider therapy modification*

Cimetidine: May decrease the excretion of Procainamide. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Procainamide may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Trimethoprim: May decrease the excretion of Procainamide. *Risk D: Consider therapy modification*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (acute ethanol administration reduces procainamide serum concentrations).

Herb/Nutraceutical: Avoid ephedra (may worsen arrhythmia).

Monitoring ParametersECG, blood pressure, CBC with differential, platelet count; cardiac monitor and blood pressure monitor required during I.V. administration; blood levels in patients with renal failure or receiving constant infusion >3 mg/minute for longer than 24 hours

Reference Range

Timing of serum samples: Draw trough just before next oral dose; draw 6-12 hours after I.V. infusion has started; half-life is 2.5-5 hours

Therapeutic levels: Procainamide: 4-10 mcg/mL; NAPA 15-25 mcg/mL; Combined: 10-30 mcg/mL

Toxic concentration: Procainamide: >10-12 mcg/mL

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. I.V. requires use of infusion pump and continuous cardiac and hemodynamic monitoring. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy, when titrating dosage, and on a regular basis with long-term therapy. **Note:** Procainamide has a low TI and overdose may easily produce severe and life-threatening reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count

Patient EducationOral: Take exactly as directed; do not take additional doses or discontinue without consulting prescriber. Avoid alcohol. You will need regular cardiac checkups and blood tests while taking this medication. You may experience dizziness, lightheadedness, or visual changes (use caution when driving or engaging in tasks requiring alertness until response to drug is known); loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); headaches (prescriber may recommend mild analgesic); or diarrhea (yogurt or boiled milk may help; if persistent consult prescriber). Report chest pain, palpitation, or erratic heartbeat; increased weight or swelling of hands or feet; shortness of breath; acute diarrhea; or unusual fatigue and tiredness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, as hydrochloride: 250 mg, 500 mg [DSC]

Injection, solution, as hydrochloride: 100 mg/mL (10 mL); 500 mg/mL (2 mL) [contains sodium metabisulfite]

Tablet, extended release, as hydrochloride: 750 mg [DSC]

Procanbid®: 500 mg, 1000 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Procainamide HCl)

250 mg (60): $37.99

500 mg (100): $79.99

Capsules (Pronestyl)

250 mg (120): $88.99

Mechanism of ActionDecreases myocardial excitability and conduction velocity and may depress myocardial contractility, by increasing the electrical stimulation threshold of ventricle, His-Purkinje system and through direct cardiac effects

Pharmacodynamics/Kinetics

Onset of action: I.M. 10-30 minutes

Distribution: V_d: Children: 2.2 L/kg; Adults: 2 L/kg; Congestive heart failure or shock: Decreased V_d

Protein binding: 15% to 20%

Metabolism: Hepatic via acetylation to produce N-acetyl procainamide (NAPA) (active metabolite)

Bioavailability: Oral: 75% to 95%

Half-life elimination:

Procainamide (hepatic acetylator, phenotype, cardiac and renal function dependent):

Children: 1.7 hours; Adults: 2.5-4.7 hours; Anephric: 11 hours

NAPA (dependent upon renal function):

Children: 6 hours; Adults: 6-8 hours; Anephric: 42 hours

Time to peak, serum: Capsule: 45 minutes to 2.5 hours; I.M.: 15-60 minutes

Excretion: Urine (25% as NAPA)

Related Information

- Antiarrhythmic Drugs
- Depression

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste disorder.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsProcainamide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause dizziness, confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone. May rarely cause agranulocytosis; use caution with clozapine and carbamazepine. Concurrent use with phenothiazines, TCAs, or beta-blockers may produce AV block.

Cardiovascular ConsiderationsIn patients with pre-existing cardiovascular disease, the incidence of proarrhythmia and mortality may be increased with Class Ia antiarrhythmic agents. Procainamide may be used to pharmacologically convert atrial fibrillation to normal sinus rhythm. In this setting, it is important that AV nodal conduction be controlled (digoxin, beta-blocker, calcium channel blocker) prior to cardioversion to inhibit procainamide-induced increases in ventricular response. Patients should be monitored (ECG) in a controlled setting when initiating therapy. Therapy should be discontinued or the dose reduced if the QT interval increases ≥25% from baseline.

Anesthesia and Critical Care Concerns/Other ConsiderationsIn patients with pre-existing cardiovascular disease, the incidence of proarrhythmia and mortality may be increased with Class Ia antiarrhythmic agents.

Procainamide may be used to pharmacologically convert atrial fibrillation to normal sinus rhythm. In this setting, it is important that AV nodal conduction be controlled (eg, digoxin, beta-blocker, calcium channel blocker) prior to cardioversion to inhibit procainamide-induced increases in ventricular response. Patients should be monitored (ECG and BP) in a controlled setting when initiating therapy.

Index TermsPCA (error-prone abbreviation); Procainamide Hydrochloride; Procaine Amide Hydrochloride

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(PROE kane)
U.S. Brand NamesNovocain®
Pharmacologic CategoryLocal Anesthetic
Use: Labeled IndicationsProduces spinal anesthesia
Dosing: Adults**Spinal analgesia:** Extent of anesthesia:

Perineum: Total dose: 50 mg; Procaine 10%: 0.5 mL with 0.5 mL diluent

Perineum and lower extremities: Total dose: 100 mg; Procaine 10%: 1 mL with 1 mL diluent

Up to costal margin: Total dose: 200 mg; Procaine 10%: 2 mL with 1 mL diluent

Dosing: ElderlyRefer to adult dosing.
CompatibilityStable in NS, sterile distilled water, spinal fluid, sterile dextrose solution (for hyperbaric technique).
ContraindicationsHypersensitivity to procaine, PABA, parabens, other ester local anesthetics, or any component of the formulation; septicemia; infection at the injection site; cerebrospinal system infections (eg, meningitis, syphilis)
Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.

- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest.

- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; may be more susceptible to toxic effects of local anesthetics.

- Endocrine disease: Use with caution in patients with endocrine disease; may be more susceptible to toxic effects of local anesthetics.

- Hyperthyroidism: Use with caution in patients with hyperthyroidism; may be more susceptible to toxic effects of local anesthetics.

Special populations:

- Acutely ill patients: Use with caution in acutely ill; reduce dose consistent with age and physical status.

- Debilitated patients: Use with caution in debilitated patients; reduce dose consistent with age and physical status.

- Elderly: Use with caution in the elderly; reduce dose consistent with age and physical status.

- Pediatrics: Use with caution in children; reduce dose consistent with age and physical status.

Dosage form specific issues:

- Sodium metabisulfite: May contain sodium metabisulfite; use caution in patients with a sulfite allergy.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.

- Trained personnel: Clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Local anesthetics cross the placenta; effects to the fetus depend on procedure and type of administration.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, cardiac arrest, edema, hyper-/hypotension

Central nervous system: Dizziness, drowsiness, nervousness, seizure, tremor

Dermatologic: Cutaneous lesions (onset may be delayed), urticaria

Ocular: Blurred vision

Respiratory: Respiratory arrest

Miscellaneous: Allergic reactions

Drug Interactions

Sulfonamide Derivatives: Procaine may diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringMonitor response, degree of pain sensation, and injection site. **Epidural:** Monitor CNS status.
Patient EducationThe purpose of this medication is to reduce pain sensation. Report local burning or pain at injection site. Report persistent diarrhea. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride:

Novocain®: 10% (2 mL) [contains sodium bisulfite]

Generic AvailableNo
Mechanism of ActionBlocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction
Pharmacodynamics/Kinetics

Onset of action: 2-5 minutes

Duration (patient, type of block, concentration, and method of anesthesia dependent); 0.5-1.5 hours

Metabolism: Rapidly hydrolyzed by plasma enzymes to PABA and diethylaminoethanol (80% conjugated before elimination)

Half-life elimination: 7.7 minutes

Excretion: Urine (as metabolites and some unchanged drug)

Dental Health: Effects on Dental TreatmentThis is no longer a useful anesthetic in dentistry due to high incidence of allergic reactions.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentIf used with a vasoconstrictor, the effects of MAO inhibitors may be enhanced
Index TermsProcaine Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Procarbazine may be confused with dacarbazine

Matulane® may be confused with Modane®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(proe KAR ba zeen)

U.S. Brand NamesMatulane®

Canadian Brand NamesMatulane®; Natulan®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent

Use: Labeled IndicationsTreatment of Hodgkin's disease

Use: Unlabeled/InvestigationalTreatment of non-Hodgkin's lymphoma, brain tumors, melanoma, lung cancer, multiple myeloma

Dosing: AdultsRefer to individual protocols.

Chemotherapy: Oral: Initial: 2-4 mg/kg/day in single or divided doses for 7 days then increase dose to 4-6 mg/kg/day until response is obtained or leukocyte count decreased <4000/mm^3 or the platelet count decreased <100,000/mm^3; maintenance: 1-2 mg/kg/day

Dosing: ElderlyRefer to adult dosing; use with caution. Adjust for renal impairment.

Dosing: PediatricRefer to individual protocols. Manufacturer states that the dose is based on patient's ideal weight if the patient is obese or has abnormal fluid retention. Other studies suggest that ideal body weight may not be necessary. Oral (may be given as a single daily dose or in 2-3 divided doses): Children:

BMT aplastic anemia conditioning regimen: 12.5 mg/kg/day every other day for 4 doses

Hodgkin's disease: MOPP/IC-MOPP regimens: 100 mg/m^2/day for 14 days and repeated every 4 weeks

Neuroblastoma and medulloblastoma: Doses as high as 100-200 mg/m^2/day once daily have been used.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain dosing adjustment guidelines; use with caution; may result in increased toxicity.

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain dosing adjustment guidelines; use with caution; may result in increased toxicity. The following guidelines have been used by some clinicians:

Floyd, 2006:

Transaminases 1.6-6 times ULN: Administer 75% of dose

Transaminases >6 times ULN: Use clinical judgment

Serum bilirubin >5 mg/dL or transaminases >3 times ULN: Avoid use

King, 2001: Serum bilirubin >5 mg/dL or transaminases >180 units/L: Avoid use

Dosing: Combination Regimens

- Body Surface Area: Pediatrics

Administration: OralMay be given as a single daily dose or in 2-3 divided doses.

Dietary ConsiderationsAvoid tyramine-containing foods/beverages. Some examples include aged or matured cheese, air-dried or cured meats (including sausages and salamis), fava or broad bean pods, tap/draft beers, Marmite concentrate, sauerkraut, soy sauce and other soybean condiments.

StorageProtect from light.

ContraindicationsHypersensitivity to procarbazine or any component of the formulation; pre-existing bone marrow aplasia; ethanol ingestion; pregnancy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: May occur 2-8 weeks after treatment initiation; allow ≥1 month interval between radiation therapy or myelosuppressive chemotherapy and initiation of treatment. Withhold treatment for leukopenia (WBC <4000/mm^3) or thrombocytopenia (platelets <100,000/mm^3).
- CNS toxicity: Withhold treatment for CNS toxicity.
- Diarrhea: Withhold treatment for diarrhea.
- Disulfiram-like reaction: Avoid ethanol consumption, may cause disulfiram-like reaction.
- Hemolysis: May cause hemolysis and/or presence of Heinz inclusion bodies in erythrocytes.
- Hemorrhage: Withhold treatment for hemorrhage.
- Hypersensitivity: Withhold treatment for hypersensitivity.
- Infertility: May cause infertility.
- Secondary malignancies: Possibly carcinogenic; acute leukemia and lung cancer have been reported following use.
- Stomatitis: Withhold treatment for stomatitis.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- MAO inhibitor activity: Possesses MAO inhibitor activity and has potential for severe drug and food interactions; follow MAO-I diet.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenic effects. There are no adequate and well-controlled studies in pregnant women. There are, however, case reports of fetal malformations in the offspring of pregnant women exposed to procarbazine as part of a combination chemotherapy regimen. Women of childbearing potential should avoid becoming pregnant during treatment.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsMost frequencies not defined.

Cardiovascular: Edema, flushing, hypotension, syncope, tachycardia

Central nervous system: Apprehension, ataxia, chills, coma, confusion, depression, dizziness, drowsiness, fatigue, fever, hallucination, headache, insomnia, lethargy, nervousness, nightmares, pain, seizure, slurred speech

Dermatologic: Alopecia, dermatitis, hyperpigmentation, petechiae, pruritus, purpura, rash, urticaria

Endocrine & metabolic: Gynecomastia (in prepubertal and early pubertal males)

Hematologic: Eosinophilia; hemolysis (in patients with G6PD deficiency); hemolytic anemia; myelosuppression (leukopenia, anemia, thrombocytopenia); pancytopenia

Gastrointestinal: Abdominal pain, anorexia, constipation, diarrhea, dysphagia, hematemesis, melena; nausea and vomiting ([60% to 90%], increasing the dose in a stepwise fashion over several days may minimize); stomatitis, xerostomia

Genitourinary: Azoospermia (reported with combination chemotherapy), hematuria, nocturia, polyuria, reproductive dysfunction (>10%)

Hepatic: Hepatic dysfunction, jaundice

Neuromuscular & skeletal: Arthralgia, falling, foot drop, myalgia, neuropathy, paresthesia, reflex diminished, tremor, unsteadiness, weakness

Ocular: Diplopia, inability to focus, nystagmus, papilledema, photophobia, retinal hemorrhage

Otic: Hearing loss

Respiratory: Cough, epistaxis, hemoptysis, hoarseness, pleural effusion, pneumonitis, pulmonary toxicity (<1%)

Miscellaneous: Allergic reaction, diaphoresis, herpes, infection, secondary malignancies (2% to 15%; reported with combination therapy)

Oncology: Emetic PotentialModerately high (60% to 90%)

Drug Interactions

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Linezolid: MAO Inhibitors may enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Lithium: MAO Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: May enhance the adverse/toxic effects of procarbazine; concurrent use not recommended.

Food: Concurrent ingestion of foods rich in tyramine may cause sudden and severe high blood pressure (hypertensive crisis). Avoid tyramine-containing foods with MAO-Is. Food's freshness is also an important concern; improperly stored or spoiled food can create an environment where tyramine concentrations may increase.

Herb/Nutraceuticals: Avoid supplements containing caffeine, tyrosine, tryptophan, or phenylalanine. Ingestion of large quantities may increase the risk of severe side effects (eg, hypertensive reactions, serotonin syndrome).

Monitoring ParametersCBC with differential, platelet and reticulocyte count, urinalysis, liver function test, renal function test.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking (eg, CNS depressants increase risk of adverse reactions). Emetic potential is high; antiemetic is generally required. Assess results of laboratory tests and patient response frequently (eg, neurotoxicity, nausea and vomiting, pneumonitis, arthralgia, paresthesia). Instruct patient about dietary and alcohol cautions (procarbazine has some MAO inhibitory effects, can result in life-threatening hypertension with tyramine [see Tyramine Content of Foods]; alcohol may cause disulfiram like reaction). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet and reticulocyte count, urinalysis, liver and renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed. Avoid alcohol; may cause acute disulfiram reaction (headache, respiratory difficulties, nausea, vomiting, sweating, thirst, hypotension, and flushing). Avoid tobacco. Avoid tyramine-containing foods; could cause serious hypertensive effects. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be more sensitive to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause considerable nausea or vomiting (consult prescriber for approved antiemetic); mental depression, nervousness, insomnia, nightmares, dizziness, confusion, or lethargy (use caution when driving or engaging in tasks that require alertness until response to drug is known); rash, hair loss, or hyperpigmentation (reversible), loss of libido, sterility, or amenorrhea. Report persistent fever, chills, sore throat; unusual bleeding; blood in urine, stool (black stool), or vomitus; unresolved depression; mania; hallucinations; nightmares; disorientation; seizures; chest pain or palpitations; respiratory difficulty; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Male: Do not cause a female to become pregnant. Male/female: Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride:

Matulane®: 50 mg

Generic AvailableNo

Mechanism of ActionMechanism of action is not clear, methylating of nucleic acids; inhibits DNA, RNA, and protein synthesis; may damage DNA directly and suppresses mitosis; metabolic activation required by host

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: Crosses blood-brain barrier; equilibrates between plasma and CSF

Metabolism: Hepatic and renal

Half-life elimination: 1 hour

Time to peak, plasma: 1 hour

Excretion: Urine and respiratory tract (<5% as unchanged drug, 70% as metabolites)

Related Information

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Prochlorperazine may be confused with chlorproMAZINE

Compazine® may be confused with Copaxone®, Coumadin®

CPZ (occasional abbreviation for Compazine®) is an error-prone abbreviation (mistaken as chlorpromazine)

Pronunciation(proe klor PER a zeen)
U.S. Brand Names Compro™
Canadian Brand Names Apo-Prochlorperazine®; Nu-Prochlor; Stemetil®
Pharmacologic Category Antiemetic; Antipsychotic Agent, Typical, Phenothiazine
Use: Labeled Indications Management of nausea and vomiting; psychotic disorders including schizophrenia; anxiety
Use: Unlabeled/Investigational Behavioral syndromes in dementia; psychosis/agitation related to Alzheimer's dementia
Dosing: Adults

Antiemetic:

Oral (tablet): 5-10 mg 3-4 times/day; usual maximum: 40 mg/day; larger doses may rarely be required

I.M. (deep): 5-10 mg every 3-4 hours; usual maximum: 40 mg/day

I.V.: 2.5-10 mg; maximum 10 mg/dose or 40 mg/day; may repeat dose every 3-4 hours as needed

Rectal: 25 mg twice daily

Surgical nausea/vomiting:Note: Should not exceed 40 mg/day

I.M.: 5-10 mg 1-2 hours before induction or to control symptoms during or after surgery; may repeat once if necessary

I.V. (administer slow IVP <5 mg/minute): 5-10 mg 15-30 minutes before induction or to control symptoms during or after surgery; may repeat once if necessary

Rectal (unlabeled use): 25 mg

Antipsychotic:

Oral: 5-10 mg 3-4 times/day; titrate dose slowly every 2-3 days; doses up to 150 mg/day may be required in some patients for treatment of severe disturbances

I.M.: Initial: 10-20 mg; if necessary repeat initial dose every 1-4 hours to gain control; more than 3-4 doses are rarely needed. If parenteral administration is still required; give 10-20 mg every 4-6 hours; change to oral as soon as possible.

Nonpsychotic anxiety: *Oral (tablet):* Usual dose: 15-20 mg/day in divided doses; do not give doses >20 mg/day or for longer than 12 weeks

Dosing: ElderlyDementia behavior (nonpsychotic, unlabeled use): Initial: 2.5-5 mg 1-2 times/day; increase dose at 4- to 7-day intervals by 2.5-5 mg/day. Increase dosing intervals (twice daily, 3 times/day, etc) as necessary to control response or side effects. Maximum daily dose should probably not exceed 75 mg in the elderly. Gradual increases (titration) may prevent some side effects or decrease their severity. See Geriatric Considerations.

Dosing: PediatricNot recommended in children <10 kg or <2 years.

Antiemetic:

Oral, rectal: >9 kg: 0.4 mg/kg/24 hours in 3-4 divided doses; **or**

9-13 kg: 2.5 mg every 12-24 hours as needed; maximum: 7.5 mg/day

13.1-17 kg: 2.5 mg every 8-12 hours as needed; maximum: 10 mg/day

17.1-37 kg: 2.5 mg every 8 hours or 5 mg every 12 hours as needed; maximum: 15 mg/day

I.M.: 0.13 mg/kg/dose; change to oral as soon as possible

Antipsychotic: Children 2-12 years (not recommended in children <9 kg or <2 years):

Oral, rectal: 2.5 mg 2-3 times/day; do not give more than 10 mg the first day; increase dosage as needed to maximum daily dose of 20 mg for 2-5 years and 25 mg for 6-12 years

I.M.: 0.13 mg/kg/dose; change to oral as soon as possible

Administration: I.M.Inject by deep IM into outer quadrant of buttocks.

Administration: I.V.Doses should be given as a short (~30 minute) infusion to avoid orthostatic hypotension; administer at ≤5 mg/minute

Administration: I.V. DetailDo not dilute with any diluent containing parabens as a preservative. Avoid skin contact with injection solution, contact dermatitis has occurred. I.V. may be administered IVP or IVPB.

pH: 4.2-6.2

Dietary ConsiderationsIncrease dietary intake of riboflavin; should be administered with food or water. Rectal suppositories may contain coconut and palm oil.

Storage

Injection: Store at <30°C (<86°F); do not freeze. Protect from light. Clear or slightly yellow solutions may be used.

I.V. infusion: Injection may be diluted in 50-100 mL NS or D_5W.

Suppository, tablet: Store at 15°C to 30°C (59°F to 86°F). Protect from light.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5W, $D_{10}W$, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Amsacrine, calcium gluconate, cisatracurium, cisplatin, cladribine, clarithromycin, cyclophosphamide, cytarabine, docetaxel, doxorubicin, doxorubicin liposome, fluconazole, gatifloxacin, granisetron, heparin, hydrocortisone sodium succinate, linezolid, melphalan, methotrexate, ondansetron, paclitaxel, potassium chloride, propofol, remifentanil, sargramostim, sufentanil, teniposide, thiotepa, topotecan, vinorelbine, vitamin B complex with C. **Incompatible:** Aldesleukin, allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, cefepime, etoposide phosphate, fludarabine, foscarnet, filgrastim, gemcitabine, piperacillin/tazobactam.

Compatibility in syringe: Compatible: Atropine, butorphanol, chlorpromazine, cimetidine, diamorphine, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydroxyzine, meperidine, metoclopramide, nalbuphine, pentazocine, perphenazine, promazine, promethazine, ranitidine, scopolamine, sufentanil. **Incompatible:** Dimenhydrinate, ketorolac, midazolam, morphine tartrate, pentobarbital, thiopental. **Variable (consult detailed reference):** Hydromorphone, morphine sulfate.

Compatibility when admixed: Compatible: Amikacin, ascorbic acid injection, cephalothin, dexamethasone sodium phosphate, dimenhydrinate, erythromycin lactobionate, ethacrynate, lidocaine, nafcillin, sodium bicarbonate, vitamin B complex with C. **Incompatible:** Aminophylline, amphotericin B, ampicillin, chloramphenicol, chlorothiazide, floxacillin, furosemide, heparin, hydrocortisone sodium succinate, methohexital, penicillin G sodium, phenobarbital, phenytoin, thiopental. **Variable (consult detailed reference):** Calcium gluconate, penicillin G potassium.

ContraindicationsHypersensitivity to prochlorperazine or any component of the formulation (cross-reactivity between phenothiazines may occur); severe CNS depression; coma; pediatric surgery; Reye’s syndrome; should not be used in children <2 years of age or <9 kg

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).
- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems.
- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).
- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia. Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.
- Hypotension: May occur following administration, particularly when parenteral form is used or in high dosages.
- Neuroleptic malignant syndrome (NMS): May be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Pigmentary retinopathy: May be associated with pigmentary retinopathy.
- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression; blood dyscrasias have occurred. Use only if benefits outweigh risk.
- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.
- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Prochlorperazine is not approved for this indication.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.
- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.
- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.
- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.
- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia.
- Pediatrics: Children with acute illness or dehydration are more susceptible to neuromuscular reactions (eg, dystonias); use cautiously.

Geriatric ConsiderationsDue to side effect profile (dystonias, EPS) this is not a preferred drug in the elderly for antiemetic therapy.

Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen, fluid electrolyte loss, infections, and changes in environment.

Any changes in disease status in any organ system can result in behavior changes.

In the treatment of agitated, demented, older adult patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy ConsiderationsCrosses the placenta. Isolated reports of congenital anomalies, however, some included exposures to other drugs. Jaundice, extrapyramidal signs, hyper-/hyporeflexes have been noted in newborns. Available evidence with use of occasional low doses suggests safe use during pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsOther phenothiazines are excreted in human milk; excretion of prochlorperazine is not known.

Adverse ReactionsReported with prochlorperazine or other phenothiazines. Frequency not defined.

Cardiovascular: Cardiac arrest, hypotension, peripheral edema, Q-wave distortions, T-wave distortions

Central nervous system: Agitation, catatonia, cerebral edema, cough reflex suppressed, dizziness, drowsiness, fever (mild - I.M.), headache, hyperactivity, hyperpyrexia, impairment of temperature regulation, insomnia, neuroleptic malignant syndrome (NMS), paradoxical excitement, restlessness, seizure

Dermatologic: Angioedema, contact dermatitis, discoloration of skin (blue-gray), epithelial keratopathy, erythema, eczema, exfoliative dermatitis (injectable), itching, photosensitivity, rash, skin pigmentation, urticaria

Endocrine & metabolic: Amenorrhea, breast enlargement, galactorrhea, gynecomastia, glucosuria, hyperglycemia, hypoglycemia, lactation, libido (changes in), menstrual irregularity, SIADH

Gastrointestinal: Appetite increased, atonic colon, constipation, ileus, nausea, weight gain, xerostomia

Genitourinary: Ejaculating dysfunction, ejaculatory disturbances, impotence, incontinence, polyuria, priapism, urinary retention, urination difficulty

Hematologic: Agranulocytosis, aplastic anemia, eosinophilia, hemolytic anemia, leukopenia, pancytopenia, thrombocytopenic purpura

Hepatic: Biliary stasis, cholestatic jaundice, hepatotoxicity

Neuromuscular & skeletal: Dystonias (torticollis, opisthotonos, carpopedal spasm, trismus, oculogyric crisis, protusion of tongue); extrapyramidal symptoms (pseudoparkinsonism, akathisia, dystonias, tardive dyskinesia); SLE-like syndrome, tremor

Ocular: blurred vision, cornea and lens changes, lenticular/corneal deposits, miosis, mydriasis, pigmentary retinopathy

Respiratory: Asthma, laryngeal edema, nasal congestion

Miscellaneous: Allergic reactions, diaphoresis

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Analgesics (Opioid): Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antimalarial Agents: May increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Beta-Blockers: Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Limit caffeine.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization). Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Test InteractionsFalse-positives for phenylketonuria, pregnancy, urinary amylase, uroporphyrins, urobilinogen

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS); periodic ophthalmic exams (if chronically used); extrapyramidal symptoms (EPS)

Nursing: Physical Assessment/MonitoringAssess all other medications patient may be taking. For I.V., continuously monitor blood pressure and heart rate during administration. Monitor blood pressure and heart rate, fluid balance, and dehydration. Monitor for seizures, especially with known seizure disorder. Monitor for excessive sedation, neuromuscular malignant syndrome, autonomic instability (eg, anticholinergic effects), and extrapyramidal symptoms.

Monitoring: Lab TestsBaseline liver and kidney function, CBC prior to and periodically during therapy, lipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Patient EducationTake exact amount as prescribed. Do not change brand names. Do not crush or chew tablets. Do not discontinue without consulting prescriber. Avoid alcohol or other sedatives or sleep-inducing drugs. Avoid skin contact with drug; wash immediately with warm soapy water. You may experience appetite changes; small frequent meals may help. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, tremors, or visual disturbance (especially during early therapy); use caution when driving or engaging in tasks that require alertness until response to drug is known. Do not change position rapidly (rise slowly). May cause photosensitivity reaction; use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight. Report immediately any changes in gait or muscular tremors. Report unresolved changes in voiding or elimination (constipation or diarrhea), acute dizziness or unresolved sedation, vision changes, palpitations, yellowing of skin or eyes, or changes in color of urine or stool (pink or red brown urine is expected).
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as edisylate: 5 mg/mL (2 mL, 10 mL) [contains benzyl alcohol]

Suppository, rectal: 25 mg (12s) [may contain coconut and palm oil]

Compro™: 25 mg (12s) [contains coconut and palm oils]

Tablet, as maleate: 5 mg, 10 mg [strength expressed as base]

Generic AvailableYes: Injection, tablet, suppository

Pricing: U.S. (www.drugstore.com)

Suppository (Compro)

25 mg (12): $33.99

Tablets (Prochlorperazine Maleate)

5 mg (30): $12.99

10 mg (30): $13.99

Mechanism of ActionProchlorperazine is a piperazine phenothiazine antipsychotic which blocks postsynaptic mesolimbic dopaminergic D_1 and D_2 receptors in the brain, including the chemoreceptor trigger zone; exhibits a strong alpha-adrenergic and anticholinergic blocking effect and depresses the release of hypothalamic and hypophyseal hormones; believed to depress the reticular activating system, thus affecting basal metabolism, body temperature, wakefulness, vasomotor tone and emesis

Pharmacodynamics/Kinetics

Onset of action: Oral: 30-40 minutes; I.M.: 10-20 minutes; Rectal: ~60 minutes

Peak antiemetic effect: I.V.: 30-60 minutes

Duration: Rectal: 12 hours; Oral: 3-4 hours; I.M., I.V.: Adults: 4-6 hours; I.M.: Children: 12 hours

Distribution: V_d: 1400-1548 L; crosses placenta; enters breast milk

Metabolism: Primarily hepatic; N-desmethyl prochlorperazine (major active metabolite)

Bioavailability: Oral: 12.5%

Half-life elimination: Oral: 3-5 hours; I.V.: ~7 hours

Related Information

- CMS: Long-Term Care Facility Thresholds

Pharmacotherapy PearlsNot recommended as an antipsychotic due to inferior efficacy compared to other phenothiazines.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Significant hypotension may occur, especially when the drug is administered parenterally; orthostatic hypotension is due to alpha-receptor blockade, the elderly are at greater risk for orthostatic hypotension.

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure.

Mental Health CommentWhile structurally a phenothiazine, this agent has limited antipsychotic activity and should not be used as such.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Anesthesia and Critical Care Concerns/Other ConsiderationsProchlorperazine has a faster onset of action and causes less sedation than promethazine. When compared with ondansetron (4 mg I.V.), prochlorperazine (10 mg I.M.) administered at the end of surgery more effectively reduced postoperative nausea and the need for rescue antiemetics in patients undergoing total hip or knee replacement. In patients undergoing tympanoplasty, prophylactic prochlorperazine (0.02 mg/kg I.M.) administered at the end of surgery was as effective as ondansetron (0.06 mg/kg I.V.) for reducing PONV.

Index TermsChlormeprazine; Compazine; Prochlorperazine Edisylate; Prochlorperazine Maleate

International Brand NamesAntinaus (NZ); Buccastem 3 (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Chloropernazinum (PL); Dhaperazine (HK, MY); Nautisol (BF, BJ, CI, ET, GH, GM, GN, KE, LR, MA, ML, MR, MU, MW, MY, NE, NG, SC, SD, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Prochlor (MY); Proclozine (TH); Seratil (HK); Stemetil (AE, AU, BB, BF, BH, BJ, BM, BS, BZ, CI, CY, DK, EG, ET, FI, GB, GH, GM, GN, GY, ID, IE, IL, IN, IQ, IR, IT, JM, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, NE, NG, NL, NO, OM, PK, QA, SA, SC, SD, SE, SG, SL, SN, SR, SY, TH, TN, TT, TZ, UG, YE, ZA, ZM, ZW); Stemzine (AU)

Medication Safety Issues

Sound-alike/look-alike issues:

Kemadrin® may be confused with Coumadin®

Pronunciation(proe SYE kli deen)
U.S. Brand NamesKemadrin® [DSC]
Canadian Brand NamesPMS-Procyclidine
Pharmacologic CategoryAnti-Parkinson's Agent, Anticholinergic; Anticholinergic Agent
Use: Labeled IndicationsRelieves symptoms of parkinsonian syndrome and drug-induced extrapyramidal symptoms
Dosing: Adults**Parkinson's disease or treatment of EPS:** Oral: 2.5 mg 3 times/day after meals; if tolerated, gradually increase dose, to a maximum of 20 mg/day if necessary.
Dosing: ElderlyOral: Initial: 2.5 mg once or twice daily, gradually increasing as necessary. Avoid use if possible (see Geriatric Considerations).
Dosing: Hepatic ImpairmentDecrease dose to a twice daily dosing regimen.
Administration: OralShould be administered after meals to minimize stomach upset.
Dietary ConsiderationsShould be taken after meals to minimize stomach upset.
ContraindicationsHypersensitivity to procyclidine or any component of the formulation; angle-closure glaucoma; myasthenia gravis; safe use in children not established
Warnings/Precautions

Concerns related to adverse effects:

- Anhidrosis/hyperthermia: May cause anhidrosis and hyperthermia, which may be severe; use with caution in hot weather or during exercise. The risk is increased in hot environments, particularly in the elderly, alcoholics, patients with CNS disease, and those with prolonged outdoor exposure.

- CNS effects: May be associated with confusion or hallucinations (generally at higher dosages); intensification of symptoms or toxic psychosis may occur in patients with mental disorders. May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Weakness: When given in large doses or to susceptible patients, may cause weakness and inability to move particular muscle groups.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with tachycardia, cardiac arrhythmias, hypertension, or hypotension.

- GI obstruction: Use with caution in patients with obstructive disease of the GI.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture or retention.

- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Elderly: Frequently develop increased sensitivity and require strict dosage regulation - side effects may be more severe in elderly patients with atherosclerotic changes.

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsAnticholinergic agents are generally not well tolerated in the elderly and their use should be avoided when possible. In the elderly, anticholinergic agents should not be used as prophylaxis against extrapyramidal symptoms. Elderly patients frequently develop increased sensitivity and require strict dosage regulation - side effects may be more severe in elderly patients with atherosclerotic changes.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, tachycardia

Central nervous system: Ataxia, confusion, drowsiness, fatigue, giddiness, headache, lightheadedness, loss of memory

Dermatologic: Dry skin, photosensitivity, rash

Gastrointestinal: Constipation, dry throat, epigastric distress, nausea, vomiting, xerostomia

Genitourinary: Difficult urination

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, increased intraocular pain, mydriasis

Respiratory: Dry nose

Miscellaneous: Diaphoresis decreased

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol.

Monitoring ParametersSymptoms of EPS or Parkinson's disease, pulse, anticholinergic effects (ie, CNS, bowel and bladder function)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness, renal function, and adverse reactions (eg, anticholinergic syndrome) at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed (after meals); do not increase, decrease, or discontinue without consulting prescriber. Take at the same time each day. Do not use alcohol, prescription or OTC sedatives, or CNS depressants without consulting prescriber. You may experience drowsiness, dizziness, confusion, and blurred vision (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); increased susceptibility to heat stroke, decreased perspiration (use caution in hot weather, maintain adequate fluids and reduce exercise activity); constipation (increased exercise, fluids, fruit, or fiber may help); or dry skin or nasal passages (consult prescriber for appropriate relief). Report unresolved constipation, chest pain or palpitations, respiratory difficulty, CNS changes (hallucination, loss of memory, nervousness, etc), painful or difficult urination, increased muscle spasticity or rigidity, skin rash, or significant worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, as hydrochloride:

Kemadrin®: 5 mg [scored] [DSC]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Kemadrin)

5 mg (90): $86.10

Mechanism of ActionThought to act by blocking excess acetylcholine at cerebral synapses; many of its effects are due to its pharmacologic similarities with atropine; it exerts an antispasmodic effect on smooth muscle, is a potent mydriatic; inhibits salivation

Pharmacodynamics/Kinetics

Onset of action: 30-40 minutes

Duration: 4-6 hours

Related Information

- Antiparkinsonian Agents
- Teratogenic Risks of Psychotropic Medications

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and dry throat and nose. Prolonged use of antidyskinetics may decrease or inhibit salivary flow, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsProcyclidine Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(proe JES ter one)

U.S. Brand NamesCrinone®; Endometrin®; First™-Progesterone VGS; Prochieve®; Prometrium®

Canadian Brand NamesCrinone®; Prometrium®

Pharmacologic CategoryProgestin

Use: Labeled Indications

Oral: Prevention of endometrial hyperplasia in nonhysterectomized, postmenopausal women who are receiving conjugated estrogen tablets; secondary amenorrhea

I.M.: Amenorrhea; abnormal uterine bleeding due to hormonal imbalance

Intravaginal gel: Part of assisted reproductive technology (ART) for infertile women with progesterone deficiency; secondary amenorrhea

Vaginal tablet: Part of ART for infertile women with progesterone deficiency

Dosing: AdultsFemales:

Amenorrhea: I.M.: 5-10 mg/day for 6-8 consecutive days

Amenorrhea, secondary:

Intravaginal gel: 45 mg (4% gel) every other day for 6 doses; if response is inadequate, may increase to 90 mg (8% gel) at same schedule

Oral: 400 mg every evening for 10 days

ART in patients who require progesterone supplementation:

Intravaginal gel: 90 mg (8% gel) once daily. If pregnancy occurs, may continue treatment for 10-12 weeks.

Intravaginal tablet: 100 mg 2-3 times daily starting at oocyte retrieval and continuing for up to 10 weeks.

ART in patients with partial or complete ovarian failure:

Intravaginal gel: 90 mg (8% gel) twice daily. If pregnancy occurs, continue treatment for 10-12 weeks.

Endometrial hyperplasia prevention (in postmenopausal women with a uterus who are receiving daily conjugated estrogen tablets): Oral: 200 mg as a single daily dose every evening for 12 days sequentially per 28-day cycle

Functional uterine bleeding: I.M.: 5-10 mg/day for 6 doses

Dosing: ElderlyRefer to adult dosing.

Administration: I.M.Administer deep I.M. only

Administration: Other

Vaginal gel: (A small amount of gel will remain in the applicator following insertion): Administer into the vagina directly from sealed applicator. Remove applicator from wrapper; holding applicator by thickest end, shake down to move contents to thin end; while holding applicator by flat section of thick end, twist off tab; gently insert into vagina and squeeze thick end of applicator.

For use at altitudes above 2500 feet: Remove applicator from wrapper; hold applicator on both sides of bubble in the thick end; using a lancet, make a single puncture in the bubble to relieve air pressure; holding applicator by thickest end, shake down to move contents to thin end; while holding applicator by flat section of thick end, twist off tab; gently insert into vagina and squeeze thick end of applicator.

Vaginal tablet: Insert tablet in vagina using disposable applicator provided.

StorageStore at controlled room temperature.

ContraindicationsHypersensitivity to progesterone or any component of the formulation; undiagnosed abnormal vaginal bleeding; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); known or suspected carcinoma of the breast or genital organs; hepatic dysfunction or disease; missed abortion or ectopic pregnancy; diagnostic test for pregnancy; capsules are also contraindicated for use during pregnancy

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.

- Dementia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Breast cancer: An increased risk of invasive breast cancer was observed in postmenopausal women using conjugated equine estrogens (CEE) in combination with medroxyprogesterone acetate (MPA). An increase in abnormal mammograms has also been reported with estrogen and progestin therapy.

- CNS effects: Patients should be warned that progesterone might cause transient dizziness or drowsiness during initial therapy.

- Dementia: **[U.S. Boxed Warning]: The risk of dementia may be increased in postmenopausal women;** increased incidence was observed in women ≥65 years of age taking CEE alone or in combination with MPA.

- Retinal vascular thrombosis: Discontinue pending examination in cases of sudden partial or complete vision loss, sudden onset of proptosis, diplopia, or migraine; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Progestins used in combination with estrogen should not be used to prevent coronary heart disease.** Use caution with cardiovascular disease or dysfunction. Progestins used in combination with estrogen may increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using CEE in combination with MPA. Similar risk should be assumed with other progestins.

- Depression: Use with caution in patients with a history of depression.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.

Special populations:

- Pediatrics: Not for use prior to menarche.

- Surgical patients: Whenever possible, progestins in combination with estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Dosage form specific issues:

- Benzyl alcohol: Some products may contain benzyl alcohol.

- Palm oil: Some products may contain palm oil.

- Peanut oil: Some products may contain peanut oil.

- Sesame oil: Some products may contain sesame oil.

Other warnings/precautions:

- Risks vs. benefits: Before prescribing progestin therapy in combination with estrogen to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of estrogen when added to progestin therapy. Progestins with or without estrogen should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

Geriatric ConsiderationsNot a progestin of choice in the elderly for hormonal cycling.

Pregnancy Risk FactorB (Prometrium®, per manufacturer); none established for vaginal gel, vaginal tablet, or injection

Pregnancy ConsiderationsThere is an increased risk of minor birth defects in children whose mothers take progesterones during the first 4 months of pregnancy. Hypospadias has been reported in male and mild masculinization of the external genitalia has been reported in female babies exposed during the first trimester. Cleft lip, cleft palate, congenital heart disease, patent ductus arteriosus, ventricular septal defect, intrauterine death, and spontaneous abortion have been noted in case reports following use of oral progesterone during pregnancy. High doses of progesterone would be expected to impair fertility. According to the American College of Obstetricians and Gynecologists, additional studies are needed to evaluate the use of progesterone to reduce the risk of preterm birth. If needed, use should be restricted to women with history of previous spontaneous abortion at <37 weeks. The vaginal gel and tablet are indicated for use in ART. The oral capsules are contraindicated for use during pregnancy.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Adverse Reactions

Injection (I.M.):

Cardiovascular: Cerebral edema, cerebral thrombosis, edema

Central nervous system: Depression, fever, insomnia, somnolence

Dermatologic: Acne, allergic rash (rare), alopecia, hirsutism, pruritus, rash, urticaria

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast tenderness, galactorrhea, menstrual flow changes, spotting

Gastrointestinal: Nausea, weight gain/loss

Genitourinary: Cervical erosion changes, cervical secretion changes

Hepatic: Cholestatic jaundice

Local: Injection site: Irritation, pain, redness

Ocular: Optic neuritis, retinal thrombosis

Respiratory: Pulmonary embolism

Miscellaneous: Anaphylactoid reactions

Oral capsule (percentages reported when used in combination with or cycled with conjugated estrogens):

>10%:

Central nervous system: Headache (10% to 31%), dizziness (15% to 24%), depression (19%)

Endocrine & metabolic: Breast tenderness (27%), breast pain (6% to 16%)

Gastrointestinal: Abdominal pain (6% to 12%), abdominal bloating (10% to 20%)

Genitourinary: Urinary problems (11%)

Neuromuscular & skeletal: Joint pain (20%), musculoskeletal pain (6% to 12%)

Miscellaneous: Viral infection (7% to 12%)

5% to 10%:

Cardiovascular: Chest pain (7%)

Central nervous system: Fatigue (8% to 9%), emotional lability (6%), irritability (5% to 8%), worry (8%)

Gastrointestinal: Nausea/vomiting (8%), diarrhea (8%)

Respiratory: Upper respiratory tract infection (5%), cough (8%)

Miscellaneous: Night sweats (7%)

<5%: Abscess, accidental injury, acne, angina pectoris, anxiety, arthritis, breast cancer, breast biopsy, bronchitis, cholecystectomy, concentration impaired, confusion, constipation, dyspepsia, earache, edema, fever, fungal vaginitis, gastroenteritis, hemorrhagic rectum, hernia, herpes simplex, hiatus, hypertension, hypertonia, insomnia, leg cramps, leukorrhea, lymphadenopathy, muscle disorder, myalgia, nasal congestion, palpitation, personality disorder, pharyngitis, pneumonitis, sinusitis, somnolence, speech disorder, urinary tract infection, uterine fibroid, vaginal dryness, vaginitis, verruca, vision abnormal, wound debridement, xerostomia

Postmarketing and/or case reports: Aggression, alopecia, ALT increased, anaphylactic reaction, arthralgia, AST increased, asthma, blurred vision, choking, cholestasis, cholestatic hepatitis, circulatory collapse, consciousness depressed/loss, convulsion, depersonalization, diplopia, disorientation, drunk feeling, dysarthria, dysphagia, dyspnea, endometrial carcinoma, facial edema, feeling abnormal, gait abnormal, GGT increased, hepatic enzymes increased, hepatic failure, hepatic necrosis, hepatitis, hyperglycemia, hypersensitivity, hypotension, jaundice, liver function tests increased, menorrhagia, menstrual disorder, metrorrhagia, muscle cramps, ovarian cyst, pancreatitis (acute), paresthesia, pruritus, sedation, stupor, suicidal ideation, syncope, tachycardia, throat tightness, TIA, tinnitus, tongue swelling, urticaria, vertigo, visual disturbance, walking difficulty, weight gain/loss

Vaginal gel (percentages reported with ART); also refer to oral capsule reactions listing for additional effects noted with progesterone:

>10%:

Central nervous system: Somnolence (27%), headache (13% to 17%), nervousness (16%), depression (11%)

Endocrine & metabolic: Breast enlargement (40%), breast pain (13%), libido decreased (11%)

Gastrointestinal: Constipation (27%), nausea (7% to 22%), cramps (15%), abdominal pain (12%)

Genitourinary: Perineal pain (17%), nocturia (13%)

5% to 10%:

Central nervous system: Pain (8%), dizziness (5%)

Gastrointestinal: Diarrhea (8%), bloating (7%), vomiting (5%)

Genitourinary: Vaginal discharge (7%), dyspareunia (6%), genital moniliasis (5%), genital pruritus (5%)

Neuromuscular & skeletal: Arthralgia (8%)

Vaginal tablet (percentages reported with ART); also refer to oral capsule reactions listing for additional effects noted with progesterone:

>10%:

Gastrointestinal: Abdominal pain (12%)

Miscellaneous: Post-oocyte retrieval pain (25% to 28%)

1% to 10%:

Central nervous system: Headache (3% to 4%), fatigue (2% to 3%)

Endocrine & metabolic: Ovarian hyperstimulation syndrome (7%)

Gastrointestinal: Nausea (7% to 8%), abdominal distension (4%), constipation (2% to 3%), vomiting (2% to 3%)

Genitourinary: Uterine spasm (3% to 4%), vaginal bleeding (3%), urinary tract infection (1% to 2%)

<1%: Burning, discomfort, itching, peripheral edema, urticaria, vaginal irritation

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2A6 (minor), 2C9 (minor), 2C19 (major), 2D6 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 2C19 (weak), 3A4 (weak)

Drug Interactions

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Food increases oral bioavailability.

Herb/Nutraceutical: St John's wort may decrease progesterone levels. Herbs with progestogenic properties may enhance the adverse/toxic effects of progestin; example herbs include bloodroot, chasteberry, damiana, oregano, yucca.

Test Interactions Thyroid function, metyrapone, liver function, coagulation tests, endocrine function tests

Monitoring Parameters Routine physical examination that includes blood pressure and Papanicolaou smear, breast exam, mammogram. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Signs and symptoms of thromboembolic disorders, vision changes

Nursing: Physical Assessment/Monitoring Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic effectiveness and patient response (eg, blood pressure, mammogram, and results of Pap smears and pregnancy tests before beginning treatment and at least annually). Teach patient proper use according to formulation, possible side effects/appropriate interventions (eg, annual physicals, Pap smears, and vision assessment), and adverse symptoms to report.

Patient Education Do not take any new medication during therapy unless approved by prescriber. Use exactly as directed. It is important that you have an annual physical assessment, Pap smear, and vision assessment while taking this medication. May cause temporary dizziness or drowsiness (use caution when driving or engaging in tasks that are potentially hazardous until response to drug is known), headache, joint pain, nausea and/or vomiting, mood swings, or irritability. Report immediately muscle pain or soreness; warmth, swelling, or redness in calves; shortness of breath; chest pain; sudden loss or change in vision; change in menstrual pattern (unusual bleeding, amenorrhea, breakthrough spotting); breast tenderness that does not go away; acute abdominal pain or cramping; signs of vaginal infection (drainage, pain, itching); or CNS changes (eg, blurred vision, confusion, acute anxiety, or unresolved depression).

Vaginal gel: A small amount of gel will remain in the applicator following insertion. Administer into the vagina directly from sealed applicator. Remove applicator from wrapper; holding applicator by thickest end, shake down to move contents to thin end; while holding applicator by flat section of thick end, twist off tab; gently insert into vagina and squeeze thick end of applicator.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Prometrium®: 100 mg, 200 mg [contains peanut oil]

Gel, vaginal:

Crinone®: 8% (1.45 g) [90 mg/dose; contains palm oil; 6 or 18 prefilled applicators]

Prochieve®: 4% (1.45 g) [45 mg/dose; contains palm oil; 6 prefilled applicators]; 8% (1.45 g) [90 mg/dose; contains palm oil; 6 or 18 prefilled applicators]

Injection, oil: 50 mg/mL (10 mL) [contains benzyl alcohol 10%, sesame oil]

Powder, for prescription compounding [micronized]: Progesterone USP (10 g, 25 g, 100 g, 1000 g)

Powder, for prescription compounding [wettable]: Progesterone USP (10 g, 25 g, 100 g, 1000 g)

First™-Progesterone VGS 25: Progesterone USP (0.75 g) [makes 30 progesterone 25 mg vaginal suppositories; kit contains fatty acid base, suppository mold, stirrer, filling tool, guide plate, mold cover with dispensing tool]

First™-Progesterone VGS 50: Progesterone USP (1.5 g) [makes 30 progesterone 50 mg vaginal suppositories; kit contains fatty acid base, suppository mold, stirrer, filling tool, guide plate, mold cover with dispensing tool]

First™-Progesterone VGS 100: Progesterone USP (3 g) [makes 30 progesterone 100 mg vaginal suppositories; kit contains fatty acid base, suppository mold, stirrer, filling tool, guide plate, mold cover with dispensing tool]

First™-Progesterone VGS 200: Progesterone USP (6 g) [makes 30 progesterone 200 mg vaginal suppositories; kit contains fatty acid base, suppository mold, stirrer, filling tool, guide plate, mold cover with dispensing tool]

First™-Progesterone VGS 400: Progesterone USP (12 g) [makes 30 progesterone 400 mg vaginal suppositories; kit contains fatty acid base, suppository mold, stirrer, filling tool, guide plate, mold cover with dispensing tool]

Tablet, vaginal:

Endometrin®: 100 mg (21s) [packaged with applicators]

Generic AvailableYes: Injection, powder

Pricing: U.S. (www.drugstore.com)

Capsules (Prometrium)

100 mg (30): $52.91

200 mg (30): $92.87

Gel (Crinone)

8% (8.7): $79.94

Gel (Prochieve)

4% (26.1): $152.42

8% (26.1): $220.99

Oil (Progesterone)

50 mg/mL (10): $40.99

Mechanism of ActionNatural steroid hormone that induces secretory changes in the endometrium, promotes mammary gland development, relaxes uterine smooth muscle, blocks follicular maturation and ovulation, and maintains pregnancy. When used as part of an ART program in the luteal phase, progesterone supports embryo implantation.

Pharmacodynamics/Kinetics

Absorption: Vaginal gel: Prolonged

Absorption half-life: 25-50 hours

Protein binding: Albumin (50% to 54%) and cortisol-binding protein (43% to 48%)

Metabolism: Hepatic to metabolites

Half-life elimination: Vaginal gel: 5-20 minutes

Time to peak: Oral: Within 3 hours; I.M.: ~8 hours; Vaginal tablet: ~17-24 hours

Excretion: Urine, bile, feces

Related Information

- Depression

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Progestins may predispose the patient to gingival bleeding.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsPregnenedione; Progestin

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(proe METH a zeen & KOE deen)

Pharmacologic CategoryAnalgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of coughs and upper respiratory symptoms associated with allergy or the common cold

Dosing: Adults **Upper respiratory symptoms:** Oral: 5 mL every 4-6 hours (maximum: 30 mL/24 hours)

Dosing: ElderlyRefer to dosing in individual monographs.

Dosing: Pediatric**Cough and upper respiratory symptoms:** Oral:

Children <2 years: Use of promethazine is contraindicated

Children <16 years: Use of promethazine/codeine combination is contraindicated

Children ≥16 years: Refer to adult dosing.

Dietary ConsiderationsIncrease fluids, fiber intake, and riboflavin in diet.

RestrictionsC-V

ContraindicationsHypersensitivity to promethazine, codeine, or any component of the formulation (cross-reactivity between phenothiazines may occur); children <16 years of age; coma; treatment of lower respiratory tract symptoms, including asthma

Allergy Considerations

- Opioid Allergy/Hypersensitivity
- Phenothiazine Allergy

Warnings/Precautions

Boxed warnings:

- Pediatrics: See “Special populations” below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).
- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); therefore, they should be used with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems.
- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia.
- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).
- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression; leukopenia and agranulocytosis have been reported.
- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with parkinson's disease; may have increased risk of tardive dyskinesia.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with severe respiratory disease (asthma, COPD, sleep apnea); may lead to potentially fatal respiratory depression.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: **[U.S. Boxed Warning]: The use of this combination in children <16 years of age is contraindicated;** respiratory depression, including fatalities, is associated with concomitant administration of promethazine and other respiratory depressants in children. Fatalities associated with respiratory depression have also been reported with promethazine use in children <2 years of age.

Other warnings/precautions:

- Cough control: Codeine is not recommended for use for cough control in patients with a productive cough. Dose should not be increased if cough does not respond; re-evaluate within 5 days for possible underlying pathology.

Geriatric ConsiderationsElderly may be sensitive to more anticholinergic, sedating, or constipating effects. Initiate at low dosage and increase cautiously.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents.
LactationEnters breast milk (codeine)/not recommended
Breast-Feeding ConsiderationsRefer to Codeine monograph.
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsPromethazine: **Substrate** (major) of CYP2B6, 2D6; **Inhibits** CYP2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup: Promethazine hydrochloride 6.25 mg and codeine phosphate 10 mg per 5 mL (120 mL, 473 mL) [contains alcohol]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Syrup (Promethazine-Codeine)

6.25-10 mg/5 mL (118): $9.99

Pharmacodynamics/KineticsSee individual agents.

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state "Do not use in children under four years of age." In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, "Infant Deaths Associated with Cough and Cold Medications - Two States, 2005," *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Pronunciation(proe METH a zeen & deks troe meth OR fan)

Pharmacologic CategoryAntitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of coughs and upper respiratory symptoms associated with allergy or the common cold

Dosing: Adults**Cough and upper respiratory symptoms:** Oral: 5 mL every 4-6 hours, up to 30 mL in 24 hours

Dosing: ElderlyRefer to dosing in individual monographs.
Dosing: Pediatric**Cough and upper respiratory symptoms**: Oral: Children:

<2 years: Use of promethazine is contraindicated

2-6 years: 1.25-2.5 mL every 4-6 hours up to 10 mL in 24 hours

6-12 years: 2.5-5 mL every 4-6 hours up to 20 mL in 24 hours

Dietary ConsiderationsIncrease dietary intake of riboflavin.
ContraindicationsHypersensitivity to promethazine, dextromethorphan, or any component of the formulation (cross-reactivity between phenothiazines may occur); treatment of lower respiratory tract symptoms, including asthma
Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Boxed warnings:

- Pediatrics: See “Special populations” below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).

- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); therefore, they should be used with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems.

- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression; leukopenia and agranulocytosis have been reported.

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with parkinson's disease; may have increased risk of tardive dyskinesia.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with severe respiratory disease (asthma, COPD, sleep apnea); may lead to potentially fatal respiratory depression.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: **[U.S. Boxed Warning]: Safety and efficacy of this combination have not been established in children <2 years of age (use of promethazine is contraindicated). In children ≥2 years, use the lowest possible dose; other drugs with respiratory depressant effects should be avoided.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Refer to Promethazine monograph.

LactationExcretion in breast milk unknown/not recommended

Metabolism/Transport Effects

Promethazine: **Substrate** (major) of CYP2B6, 2D6; **Inhibits** CYP2D6 (weak)

Dextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringSee individual agent for Promethazine.

Patient EducationSee individual agent for Promethazine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup: Promethazine hydrochloride 6.25 mg and dextromethorphan hydrobromide 15 mg per 5 mL (120 mL, 480 mL) [contains alcohol 7%]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Syrup (Promethazine-DM)

6.25-15 mg/5 mL (118): $8.99

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Dextromethorphan
- Promethazine

Dental Health: Effects on Dental TreatmentAlthough promethazine is a phenothiazine derivative, extrapyramidal reactions or tardive dyskinesias are not seen with the use of this drug.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

Index TermsDextromethorphan and Promethazine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(proe METH a zeen & fen il EF rin)

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of upper respiratory symptoms associated with allergy or the common cold

Dosing: AdultsUpper respiratory symptoms: Oral: 5 mL every 4-6 hours, not to exceed 30 mL in 24 hours

Dosing: ElderlyRefer to dosing in individual monographs.

Dosing: PediatricUpper respiratory symptoms: Oral: Children:

<2 years: Use of promethazine is contraindicated

2-6 years: 1.25-2.5 mL every 4-6 hours, not to exceed 7.5 mL in 24 hours

6-12 years: 2.5-5 mL every 4-6 hours, not to exceed 30 mL in 24 hours

>12 years: Refer to adult dosing.

Dietary ConsiderationsIncrease dietary intake of riboflavin.

ContraindicationsHypersensitivity to promethazine, phenylephrine, or any component of the formulation (cross-reactivity between phenothiazines may occur;) treatment of lower respiratory tract symptoms, including asthma; hypertension; ventricular tachycardia; peripheral vascular insufficiency; use with or within 14 days of MAO inhibitor therapy

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Boxed warnings:

- Pediatrics: See “Special populations” below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).

- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); therefore, they should be used with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems.

- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression; leukopenia and agranulocytosis have been reported.

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Diabetes: Use phenylephrine with caution in patients with diabetes mellitus.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma and/or increased intraocular pressure; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Hyperthyroidism: Use phenylephrine with caution in patients with hyperthyroidism.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with parkinson's disease; may have increased risk of tardive dyskinesia.

- Prostatic hyperplasia: Use phenylephrine with caution in patients with prostatic hyperplasia.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with severe respiratory disease (asthma, COPD, sleep apnea); may lead to potentially fatal respiratory depression.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use phenylephrine with caution in the elderly.

- Pediatrics: **[U.S. Boxed Warning]: Safety and efficacy of this combination have not been established in children <2 years of age (use of promethazine is contraindicated). In children ≥2 years, use the lowest possible dose; other drugs with respiratory depressant effects should be avoided.**

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Refer to Promethazine monograph.
LactationExcretion in breast milk unknown/not recommended
Metabolism/Transport EffectsPromethazine: **Substrate** (major) of CYP2B6, 2D6; **Inhibits** CYP2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression). Avoid ephedra, yohimbe (may cause CNS stimulation).

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup: Promethazine hydrochloride 6.25 mg and phenylephrine hydrochloride 5 mg per 5 mL (473 mL) [contains alcohol]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Syrup (Promethazine VC)

6.25-5 mg/5 mL (118): $27.99

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Phenylephrine
- Promethazine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Phenylephrine: Tachycardia, palpitations, xerostomia (normal salivary flow resumes upon discontinuation); use vasoconstrictor with caution. Although promethazine is a phenothiazine derivative, extrapyramidal reactions or tardive dyskinesias are not seen with the use of this drug.
Dental Health: Vasoconstrictor/Local Anesthetic Precautions

Phenylephrine: Use with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Promethazine: No information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

Pronunciation(proe METH a zeen, fen il EF rin, & KOE deen)

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of coughs and upper respiratory symptoms including nasal congestion associated with allergy or the common cold

Dosing: Adults**Cough and upper respiratory symptoms:** Oral: 5 mL every 4-6 hours, not to exceed 30 mL/24 hours

Dosing: ElderlyRefer to dosing in individual monographs.

Dosing: Pediatric**Cough and upper respiratory symptoms:** Oral:

Children <2 years: Use of promethazine is contraindicated

Children <16 years: Use of promethazine/codeine combination is contraindicated

Children ≥16 years: Refer to adult dosing.

Dietary ConsiderationsMay be taken with food or water to decrease GI upset; increase fiber intake and riboflavin in diet.

RestrictionsC-V

ContraindicationsHypersensitivity to promethazine, phenylephrine, codeine, or any component of the formulation (cross-reactivity between phenothiazines may occur); children <16 years of age; coma; treatment of lower respiratory tract symptoms, including asthma; hypertension; ventricular tachycardia; peripheral vascular insufficiency; use with or within 14 days of MAO inhibitor therapy

Allergy Considerations

- Opioid Allergy/Hypersensitivity
- Phenothiazine Allergy

Warnings/Precautions

Boxed warnings:

- Pediatrics: See “Special populations” below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).
- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); therefore, they should be used with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems.
- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia.
- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).
- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression; leukopenia and agranulocytosis have been reported.
- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Diabetes: Use phenylephrine with caution in patients with diabetes mellitus.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Hyperthyroidism: Use phenylephrine with caution in patients with hyperthyroidism.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.
- Parkinson's disease: Use with caution in patients with parkinson's disease; may have increased risk of tardive dyskinesia.
- Prostatic hyperplasia: Use phenylephrine with caution in patients with prostatic hyperplasia.
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with severe respiratory disease (asthma, COPD, sleep apnea); may lead to potentially fatal respiratory depression.
- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.
- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use phenylephrine with caution in the elderly.
- Pediatrics: **[U.S. Boxed Warning]: The use of this combination in children <16 years of age is contraindicated;** respiratory depression, including fatalities, is associated with concomitant administration of promethazine and other respiratory depressants in children. Fatalities associated with respiratory depression have also been reported with promethazine use in children <2 years of age.

Other warnings/precautions:

- Cough control: Codeine is not recommended for use for cough control in patients with a productive cough. Dose should not be increased if cough does not respond; re-evaluate within 5 days for possible underlying pathology.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsCodeine enters breast milk; excretion of promethazine and phenylephrine is unknown. Also refer to Codeine monograph.
Adverse ReactionsSee individual agents.
Metabolism/Transport Effects

Promethazine: **Substrate** (major) of CYP2B6, 2D6; **Inhibits** CYP2D6 (weak)

Codeine: **Substrate** of CYP2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression). Avoid ephedra, yohimbe (may cause CNS stimulation).

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Promethazine may be confused with chlorproMAZINE, predniSONE, promazine

Phenergan® may be confused with Phenaphen®, PHENobarbital, Phrenilin®, Theragran®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Administration issues:

To prevent or minimize tissue damage during I.V. administration, the Institute for Safe Medication Practices (ISMP) has the following recommendations:

Limit concentration available to the 25 mg/mL product

Consider limiting initial doses to 6.25-12.5 mg

Further dilute the 25 mg/mL strength into 10-20 mL NS

Administer through a large bore vein (not hand or wrist)

Administer via running I.V. line at port furthest from patient's vein

Consider administering over 10-15 minutes

Instruct patients to report immediately signs of pain or burning

Pronunciation(proe METH a zeen)

U.S. Brand NamesPhenadoz™; Phenergan®; Promethegan™

Canadian Brand NamesBioniche Promethazine; Histantil; Phenergan®; PMS-Promethazine

Pharmacologic CategoryAntiemetic; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic treatment of various allergic conditions; antiemetic; motion sickness; sedative; postoperative pain (adjunctive therapy); anesthetic (adjunctive therapy); anaphylactic reactions (adjunctive therapy)

Dosing: Adults

Allergic conditions (including allergic reactions to blood or plasma):

Oral, rectal: 25 mg at bedtime **or** 12.5 mg before meals and at bedtime (range: 6.25-12.5 mg 3 times/day)

I.M., I.V.: 25 mg, may repeat in 2 hours when necessary; switch to oral route as soon as feasible

Antiemetic: Oral, I.M., I.V., rectal: 12.5-25 mg every 4-6 hours as needed

Motion sickness: Oral, rectal: 25 mg 30-60 minutes before departure, then every 12 hours as needed

Sedation: Oral, I.M., I.V., rectal: 12.5-50 mg/dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Allergic conditions: Children ≥2 years: Oral, rectal: 0.1 mg/kg/dose (maximum: 12.5 mg) every 6 hours during the day and 0.5 mg/kg/dose (maximum: 25 mg) at bedtime as needed

Antiemetic: Children ≥2 years: Oral, I.M., I.V., rectal: 0.25-1 mg/kg 4-6 times/day as needed (maximum: 25 mg/dose)

Motion sickness: Children ≥2 years: Oral, rectal: 0.5 mg/kg/dose 30 minutes to 1 hour before departure, then every 12 hours as needed (maximum dose: 25 mg twice daily)

Sedation: Children ≥2 years: Oral, I.M., I.V., rectal: 0.5-1 mg/kg/dose every 6 hours as needed (maximum: 50 mg/dose)

Administration: I.M.Preferred route of administration; administer into deep muscle

Administration: I.V.I.V. administration is **not** the preferred route; severe tissue damage may occur. Solution for injection should be administered in a maximum concentration of 25 mg/mL (more dilute solutions are recommended). Administer via running I.V. line at port furthest from patient's vein, or through a large bore vein (not hand or wrist). Consider administering over 10-15 minutes (maximum: 25 mg/minute). Discontinue immediately if burning or pain occurs with administration.

Administration: I.V. DetailRapid I.V. administration may produce a transient fall in blood pressure.

pH: 4.0-5.5

Administration: OtherNot for SubQ or intra-arterial administration.

Dietary ConsiderationsIncrease dietary intake of riboflavin.

Storage

Injection: Prior to dilution, store at room temperature. Protect from light. Solutions in NS or D_5W are stable for 24 hours at room temperature.

Suppositories: Store refrigerated at 2°C to 8°C (36°F to 46°F).

Tablets: Store at room temperature. Protect from light.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5W, $D_{10}W$, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Amifostine, amsacrine, aztreonam, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, docetaxel, doxorubicin, etoposide phosphate, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, granisetron, linezolid, melphalan, ondansetron, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Aldesleukin, allopurinol, amphotericin B cholesteryl sulfate complex, cefazolin, cefepime, cefoperazone, cefotetan, doxorubicin liposome, foscarnet, methotrexate, piperacillin/tazobactam. **Variable (consult detailed reference):** Cefazolin, ceftizoxime, heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Compatibility in syringe: Compatible: Atropine, atropine with meperidine, butorphanol, chlorpromazine, cimetidine, dihydroergotamine, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, pentazocine, perphenazine, prochlorperazine edisylate, promazine, ranitidine, scopolamine. **Incompatible:** Cefotetan, chloroquine, diatrizoate sodium 75%, diatrizoate meglumine 52% with diatrizoate sodium 8%, diatrizoate meglumine 34.3% with diatrizoate sodium 35%, dimenhydrinate, heparin, iodipamide meglumine 52%, iothalamate meglumine 60%, iothalamate sodium 80%, ketorolac, pentobarbital, thiopental. **Variable (consult detailed reference):** Morphine, nalbuphine.

Compatibility when admixed: Compatible: Amikacin, ascorbic acid injection, buprenorphine, butorphanol, chloroquine, hydromorphone, netilmicin, vitamin B complex with C. **Incompatible:** Aminophylline, chloramphenicol, chlorothiazide, dimenhydrinate, floxacillin, furosemide, heparin, hydrocortisone sodium succinate, methohexital, penicillin G sodium, pentobarbital, phenobarbital, phenytoin, thiopental. **Variable (consult detailed reference):** Penicillin G potassium.

ContraindicationsHypersensitivity to promethazine or any component of the formulation (cross-reactivity between phenothiazines may occur); coma; treatment of lower respiratory tract symptoms, including asthma; children <2 years of age

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Boxed warnings:

- Pediatrics: See "Special populations" below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).

- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); therefore, they should be used with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems.

- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression; leukopenia and agranulocytosis have been reported.

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with parkinson's disease; may have increased risk of tardive dyskinesia.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with severe respiratory disease (asthma, COPD, sleep apnea); may lead to potentially fatal respiratory depression.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: **[U.S. Boxed Warning]: Respiratory fatalities have been reported in children <2 years of age. In children ≥2 years, use the lowest possible dose; other drugs with respiratory depressant effects should be avoided.**

Dosage form specific issues:

- Sodium metabisulfite: Injection may contain sodium metabisulfite; may cause allergic reaction.

Other warnings/precautions:

- Appropriate administration: Not for SubQ or intra-arterial administration. I.M. is the preferred route of parenteral administration. I.V. use has been associated with severe tissue damage; discontinue immediately if burning or pain occurs with administration.

Geriatric ConsiderationsBecause promethazine is a phenothiazine (and can, therefore, cause side effects such as extrapyramidal symptoms), it is not considered an antihistamine of choice in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Crosses the placenta. Possible respiratory depression if drug is administered near time of delivery; behavioral changes, EEG alterations, impaired platelet aggregation reported with use during labor.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, hypertension, postural hypotension, tachycardia, nonspecific QT changes

Central nervous system: Akathisia, catatonic states, confusion, delirium, disorientation, dizziness, drowsiness, dystonias, euphoria, excitation, extrapyramidal symptoms, fatigue, hallucinations, hysteria, insomnia, lassitude, pseudoparkinsonism, tardive dyskinesia, nervousness, neuroleptic malignant syndrome, nightmares, sedation, seizure, somnolence

Dermatologic: Angioneurotic edema, photosensitivity, dermatitis, skin pigmentation (slate gray), urticaria

Endocrine & metabolic: Lactation, breast engorgement, amenorrhea, gynecomastia, hyper-/hypoglycemia

Gastrointestinal: Xerostomia, constipation, nausea, vomiting

Genitourinary: Urinary retention, ejaculatory disorder, impotence

Hematologic: Agranulocytosis, eosinophilia, leukopenia, hemolytic anemia, aplastic anemia, thrombocytopenia, thrombocytopenic purpura

Hepatic: Jaundice

Local: Venous thrombosis; injection site reactions (burning, erythema, pain, edema)

Neuromuscular & skeletal: Incoordination, tremor

Ocular: Blurred vision, corneal and lenticular changes, diplopia, epithelial keratopathy, pigmentary retinopathy

Otic: Tinnitus

Respiratory: Apnea, asthma, nasal congestion, respiratory depression

Oncology: VesicantNo; may be an irritant
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** (major) of CYP2B6, 2D6; **Inhibits** CYP2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central).

Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsAlters the flare response in intradermal allergen tests; hCG-based pregnancy tests may result in false-negatives or false-positives; increased serum glucose may be seen with glucose tolerance tests

Monitoring ParametersRelief of symptoms, mental status

Nursing: Physical Assessment/MonitoringAssess patient carefully for use cautions prior to beginning treatment. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking. Note Administration specifics for I.V. and I.M. use (do not give SubQ or intra-arterially; necrotic lesions may occur). Assess for effectiveness (according to purpose for use) and adverse response (eg, sedation, bradycardia, akathisia, delirium, extrapyramidal symptoms, dermatitis, gastrointestinal upset, urinary retention, blurred vision, respiratory depression). May be sedating and impair physical or mental abilities; use and teach sedation safety measures (eg, side rails up, call light within reach). Teach patient appropriate use (oral), interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber (especially anything that may cause CNS depression). Take this drug as prescribed; do not increase dosage. Avoid alcohol; may increase CNS depression. May cause dizziness, drowsiness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, dry mouth, appetite disturbances (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report unusual weight gain, unresolved nausea or diarrhea, chest pain or palpitations, excess sedation or stimulation, or sore throat or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution, as hydrochloride: 25 mg/mL (1 mL); 50 mg/mL (1 mL)

Phenergan®: 25 mg/mL (1 mL); 50 mg/mL (1 mL) [contains sodium metabisulfite]

Suppository, rectal, as hydrochloride: 12.5 mg, 25 mg, 50 mg

Phenadoz™: 12.5 mg, 25 mg

Phenergan®: 25 mg, 50 mg [DSC]

Promethegan™: 12.5 mg, 25 mg, 50 mg

Syrup, as hydrochloride: 6.25 mg/5 mL (120 mL, 480 mL) [contains alcohol]

Tablet, as hydrochloride: 12.5 mg, 25 mg, 50 mg

Phenergan®: 25 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Promethazine HCl)

50 mg/mL (25): $69.99

Suppository (Phenergan)

12.5 mg (12): $47.99

25 mg (12): $54.99

50 mg (12): $69.99

Suppository (Promethazine HCl)

12.5 mg (12): $29.99

50 mg (12): $49.99

Suppository (Promethegan)

25 mg (12): $52.78

50 mg (12): $75.99

Syrup (Promethazine HCl)

6.25 mg/5 mL (118): $12.99

Mechanism of Action

Blocks postsynaptic mesolimbic dopaminergic receptors in the brain; exhibits a strong alpha-adrenergic blocking effect and depresses the release of hypothalamic and hypophyseal hormones; competes with histamine for the H_1-receptor; reduces stimuli to the brainstem reticular system

Pharmacodynamics/Kinetics

Onset of action: I.M.: ~20 minutes; I.V.: 3-5 minutes

Peak effect: C_{max}: 9.04 ng/mL (suppository); 19.3 ng/mL (syrup)

Duration: 2-6 hours

Absorption:

I.M.: Bioavailability may be greater than with oral or rectal administration

Oral: Rapid and complete; large first pass effect limits systemic bioavailability

Distribution: V_d: 171 L

Protein binding: 93%

Metabolism: Hepatic; primarily oxidation; forms metabolites

Half-life elimination: 9-16 hours

Time to maximum serum concentration: 4.4 hours (syrup); 6.7-8.6 hours (suppositories)

Excretion: Primarily urine and feces (as inactive metabolites)

Dental Health: Effects on Dental Treatment

Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Significant hypotension may occur, especially when the drug is administered parenterally; orthostatic hypotension is due to alpha-receptor blockade, the elderly are at greater risk for orthostatic hypotension.

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Increased confusion, memory loss, psychotic behavior, and agitation frequently occur as a consequence of anticholinergic effects. Antipsychotic associated sedation in nonpsychotic patients is extremely unpleasant due to feelings of depersonalization, derealization, and dysphoria.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

Most pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Propafenone Tablets: Recall Due to Potential for Oversized Tablets - November 2008

Certain lots of generic propafenone tablets have been recalled due to possibility of oversized tablets. Oversized tablets may contain up to twice the amount of the active ingredient which may result in serious or life-threatening effects.

For more information, including lots involved, please refer to the FDA MedWatch alert: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Ethex

Pronunciation(pro PAF en one)

U.S. Brand NamesRythmol®; Rythmol® SR

Canadian Brand NamesApo-Propafenone®; PMS-Propafenone; Rythmol® Gen-Propafenone

Pharmacologic CategoryAntiarrhythmic Agent, Class Ic

Use: Labeled IndicationsTreatment of life-threatening ventricular arrhythmias

Rythmol® SR: Maintenance of normal sinus rhythm in patients with symptomatic atrial fibrillation

Use: Unlabeled/InvestigationalSupraventricular tachycardias, including those patients with Wolff-Parkinson-White syndrome

Dosing: Adults**Note:** Patients who exhibit significant widening of QRS complex or second- or third-degree AV block may need dose reduction.

Ventricular arrhythmias: Oral:

Immediate release tablet: Initial: 150 mg every 8 hours, increase at 3- to 4-day intervals up to 300 mg every 8 hours.

Extended release capsule: Initial: 225 mg every 12 hours; dosage increase may be made at a minimum of 5-day intervals; may increase to 325 mg every 12 hours; if further increase is necessary, may increase to 425 mg every 12 hours

Paroxysmal atrial fibrillation (unlabeled dose): Oral: *Immediate release:* Outpatient: "Pill-in-the-pocket" dose: 450 mg (weight <70 kg); 600 mg (weight ≥70 kg). May not repeat in ≤24 hours. **Note:** An initial inpatient conversion trial should have been successful before sending patient home on this approach. Patient must be taking an AV nodal-blocking agent (eg, beta-blocker, nondihydropyridine calcium channel blocker) prior to initiation of antiarrhythmic.

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentReduction is necessary; however, specific guidelines are not available.

Administration: OralCapsules should be swallowed whole; do not crush or chew.

Dietary Considerations

Capsule: May be taken without regard to food.

Rythmol® SR capsules contain soy lecithin.

Tablet: Should be taken at the same time in relation to meals each day, either always with meals or always between meals.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to propafenone or any component of the formulation; sinoatrial, AV, and intraventricular disorders of impulse generation and/or conduction (except in patients with a functioning artificial pacemaker); sinus bradycardia; cardiogenic shock; uncompensated cardiac failure; hypotension; bronchospastic disorders; uncorrected electrolyte abnormalities; concurrent use of ritonavir (see Drug Interactions)

Warnings/Precautions

Boxed warnings:

- CAST trial: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Conduction disturbances: Can cause or unmask a variety of conduction disturbances.

- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation.

Disease-related concerns:

- Bronchospastic disease: Patients with bronchospastic disease should generally not receive this drug.

- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.

- Heart failure (HF): Use with caution in patients with HF; may precipitate or exacerbate condition.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may exacerbate condition.

Concurrent drug therapy issues:

- Drugs with QT prolongation potential: Use with caution with concurrent use of any drug that can prolong QT interval.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- CAST trial: **[U.S. Boxed Warning]: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide.** An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

- Pacemakers: May alter pacing and sensing thresholds of artificial pacemakers.

Geriatric ConsiderationsElderly may have age-related decreases in hepatic Phase I metabolism. Propafenone is dependent upon liver metabolism, therefore, monitor closely in the elderly and adjust dose more gradually during initial treatment. No differences in clearance noted with impaired renal function and, therefore, no adjustment for renal function in the elderly is necessary.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women; use only if potential benefit to the mother justifies potential risk to the fetus.

LactationEnters breast milk/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: New or worsened arrhythmia (proarrhythmic effect) (2% to 10%), angina (2% to 5%), CHF (1% to 4%), ventricular tachycardia (1% to 3%), palpitation (1% to 3%), AV block (first-degree) (1% to 3%), syncope (1% to 2%), increased QRS interval (1% to 2%), chest pain (1% to 2%), PVCs (1% to 2%), bradycardia (1% to 2%), edema (0% to 1%), bundle branch block (0% to 1%), atrial fibrillation (1%), hypotension (0% to 1%), intraventricular conduction delay (0% to 1%)

Central nervous system: Dizziness (4% to 15%), fatigue (2% to 6%), headache (2% to 5%), ataxia (0% to 2%), insomnia (0% to 2%), anxiety (1% to 2%), drowsiness (1%)

Dermatologic: Rash (1% to 3%)

Gastrointestinal: Nausea/vomiting (2% to 11%), unusual taste (3% to 23%), constipation (2% to 7%), dyspepsia (1% to 3%), diarrhea (1% to 3%), xerostomia (1% to 2%), anorexia (1% to 2%), abdominal pain (1% to 2%), flatulence (0% to 1%)

Neuromuscular & skeletal: Tremor (0% to 1%), arthralgia (0% to 1%), weakness (1% to 2%)

Ocular: Blurred vision (1% to 6%)

Respiratory: Dyspnea (2% to 5%)

Miscellaneous: Diaphoresis (1%)

<1% (Limited to important or life-threatening): Agranulocytosis, leukopenia, thrombocytopenia, purpura, granulocytopenia, anemia, increased bleeding time, hepatitis (0.03%), increased serum transaminases (0.2%), prolonged PR interval, sinus node dysfunction, cholestasis (0.1%), gastroenteritis, positive ANA titers (0.7%), lupus erythematosus, AV block (second or third degree), AV dissociation, cardiac arrest, flushing, sinus arrest, abnormal speech, abnormal dreams, abnormal vision, apnea, coma, confusion, depression, memory loss, paresthesia, numbness, psychosis, seizure (0.3%), tinnitus, abnormal smell sensation, vertigo, alopecia, eye irritation, SIADH, hyponatremia, impotence, hyperglycemia, kidney failure, muscle cramps, muscle weakness, nephrotic syndrome, pain, pruritus, CHF, renal failure, nephrotic syndrome

Postmarketing and/or case reports: Peripheral neuropathy, mania, amnesia

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2D6 (weak)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Beta-Blockers: Propafenone may decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Cardiac Glycosides: Propafenone may increase the serum concentration of Cardiac Glycosides. *Risk C: Monitor therapy*

Cimetidine: May increase the serum concentration of Propafenone. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Ritonavir: May decrease the metabolism of Propafenone. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Propafenone. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Tipranavir: May increase the serum concentration of Propafenone. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Propafenone may increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Propafenone serum concentrations may be increased if taken with food.

Herb/Nutraceutical: St John's wort may decrease propafenone levels. Avoid ephedra (may worsen arrhythmia).

Monitoring ParametersECG, blood pressure, pulse (particularly at initiation of therapy)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess therapeutic effectiveness, and adverse reactions at beginning of therapy, when titrating dosage, and on a regular basis with long-term therapy. Monitor cardiac status closely. **Note:** Propafenone has a low TI and overdose may easily produce severe and life-threatening reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not take additional doses or discontinue without consulting prescriber. You will need regular cardiac checkups. You may experience dizziness, drowsiness, or visual changes (use caution when driving or engaging in tasks requiring alertness until response to drug is known); abnormal taste, nausea or vomiting, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); headaches (prescriber may recommend mild analgesic); or diarrhea (yogurt or boiled milk may help; if persistent consult prescriber). Report chest pain, palpitation, or erratic heartbeat; respiratory difficulty, increased weight or swelling of hands or feet; acute persistent diarrhea or constipation; or vision changes.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release, as hydrochloride (Rythmol® SR): 225 mg, 325 mg, 425 mg [contains soy lecithin]

Tablet, as hydrochloride (Rythmol®): 150 mg, 225 mg, 300 mg

Generic AvailableYes: Tablet

ManufacturerKnoll Pharmaceutical Company

Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Rythmol SR)

225 mg (30): $176.56

325 mg (30): $225.60

425 mg (60): $449.99

Tablets (Propafenone HCl)

150 mg (90): $115.99

225 mg (90): $119.99

300 mg (30): $70.99

Tablets (Rythmol)

225 mg (30): $154.64

Mechanism of ActionPropafenone is a class 1c antiarrhythmic agent which possesses local anesthetic properties, blocks the fast inward sodium current, and slows the rate of increase of the action potential. Prolongs conduction and refractoriness in all areas of the myocardium, with a slightly more pronounced effect on intraventricular conduction; it prolongs effective refractory period, reduces spontaneous automaticity and exhibits some beta-blockade activity.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Metabolism: Hepatic; two genetically determined metabolism groups exist: fast or slow metabolizers; 10% of Caucasians are slow metabolizers; exhibits nonlinear pharmacokinetics; when dose is increased from 300-900 mg/day, serum concentrations increase tenfold; this nonlinearity is thought to be due to saturable first-pass effect

Bioavailability: 150 mg: 3.4%; 300 mg: 10.6%

Half-life elimination: Single dose (100-300 mg): 2-8 hours; Chronic dosing: 10-32 hours

Time to peak: 150 mg dose: 2 hours, 300 mg dose: 3 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Unusual taste and significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsIn some patients, propafenone has been reported to induce new or worsened arrhythmias (proarrhythmic effect). It is suggested that vasoconstrictors be used with caution since epinephrine has the potential to stimulate the heart rate when given in the anesthetic regimen. Propafenone is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusDizziness and drowsiness are common; may cause anxiety

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; use TCAs with caution; may cause QT prolongation

Cardiovascular ConsiderationsPropafenone is a class Ic antiarrhythmic with very weak beta-blocking properties. Avoid propafenone use in patients with cardiovascular disease, particularly recent myocardial infarction and heart failure, due to a possible increase in proarrhythmia and mortality.

"Pill-in-the Pocket" administration approach: Patients with a history of palpitations with an abrupt onset, were hemodynamically stable, and had 1-12 episodes of atrial fibrillation within the previous year (and no other cardiac symptoms) were candidates for a clinical trial evaluating flecainide or propafenone for conversion of their rhythm (Alboni P, 2004). Patients had to have minimal, if any, heart disease. Only 12% of all patients evaluated for this trial were eligible for inclusion, thus this type of treatment is only for select patients meeting both inclusion and exclusion criteria. However, patients who had met inclusion criteria and were given either flecainide or propafenone in the hospital phase of the trial and converted to normal sinus rhythm were then enrolled into the ambulatory phase of the trial. Patients in this outpatient trial were to take either flecainide or propafenone at the first onset of palpitations. The doses were as follows: Flecainide 300 mg for patients ≥70 kg and 200 mg for patients <70 kg; propafenone 600 mg for patients ≥70 kg and 450 mg for patients <70 kg. Patients were instructed to sit or lie down after taking either drug until palpitations had stopped or for at least 4 hours. If palpitations had not subsided after 6–8 hours, then the patients were instructed to go to the emergency room. They were not to take more than one dose in a 24-hour period. This treatment regimen demonstrated that 94% of episodes in the 165 patients studied were successfully treated with a mean time to symptom resolution of 113 minutes. Adverse events were reported in 12 patients. One patient developed atrial flutter with a rapid ventricular response that required an emergency room visit. The other 11 patients complained of noncardiac side effects (eg, nausea, weakness, and vertigo). This therapy demonstrated a significant reduction in emergency room visits and hospitalization.

Selected patients with infrequent paroxysmal atrial fibrillation may be candidates for the “Pill-in-the-Pocket” regimen. Many patients may not be appropriate candidates for this regimen, based on previous clinical studies – CAST, CAST 2, CASH; a number of exclusion criteria define the potential harm of these agents.

Anesthesia and Critical Care Concerns/Other ConsiderationsAs with other class 1c agents, avoid use in patients with cardiovascular disease.

Index TermsPropafenone Hydrochloride

Propantheline

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(proe PAN the leen)
Pharmacologic Category[Anticholinergic Agent]
Use: Labeled IndicationsAdjunctive treatment of peptic ulcer, irritable bowel syndrome, pancreatitis, ureteral and urinary bladder spasm; reduce duodenal motility during diagnostic radiologic procedures
Use: DentalInduce dry field (xerostomia) in oral cavity
Dosing: Adults

Antisecretory: Oral: 15 mg 3 times/day before meals or food and 30 mg at bedtime

Antispasmodic: Oral: 15 mg 3 times/day before meals or food and 30 mg at bedtime

Dosing: ElderlyAntisecretory: 7.5 mg 3 times/day before meals and at bedtime; increase as necessary to a maximum of 30 mg 3 times/day
Dosing: Pediatric

Antisecretory: Oral: Children: 1-2 mg/kg/day in 3-4 divided doses

Antispasmodic: Oral: Children: 2-3 mg/kg/day in divided doses every 4-6 hours and at bedtime

Dietary ConsiderationsShould be taken 30 minutes before meals so that the drug's peak effect occurs at the proper time. The tablet (15 mg) contains lactose 23.2 mg.
ContraindicationsHypersensitivity to propantheline or any component of the formulation; ulcerative colitis, toxic megacolon, obstructive disease of the GI or urinary tract; narrow-angle glaucoma; myasthenia gravis
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Diarrhea: May be a sign of incomplete intestinal obstruction, treatment should be discontinued if this occurs.
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, tachyarrhythmias, heart failure, or hypertension; evaluate tachycardia prior to administration.
- Endocrine disease: Use with caution in patients with endocrine diseases.
- Gastrointestinal infections: Use with caution in patients with GI infections.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hiatal hernia: Use with caution in patients with hiatal hernia with reflux esophagitis.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for anticholinergic effects, confusion, and hallucinations.

Geriatric ConsiderationsThe primary use of propantheline in the geriatric population is for treatment of urinary incontinence due to detrusor instability. Even though it does not cross the blood-brain barrier, CNS effects have been reported. Orthostatic hypotension may also occur, therefore, avoid long-term use in the elderly.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Breast-Feeding ConsiderationsNo data reported; however, atropine may be taken while breast-feeding.
Adverse ReactionsFrequency not defined.

Dermatologic: Dry skin

Gastrointestinal: Constipation, dry mouth and throat, dysphagia

Respiratory: Dry nose

Miscellaneous: Diaphoresis (decreased)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as bromide: 15 mg [contains lactose 23.2 mg]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Propantheline Bromide)

15 mg (30): $21.99

Mechanism of ActionCompetitively blocks the action of acetylcholine at postganglionic parasympathetic receptor sites

Pharmacodynamics/Kinetics

Onset of action: 30-45 minutes

Duration: 4-6 hours

Half-life elimination, serum: Average: 1.6 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (therapeutic effect; normal salivary flow resumes upon discontinuation), dry throat, nasal dryness, and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, confusion, amnesia, nervousness, or insomnia

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation or anticholinergic side effects (dry mouth)

Index TermsPropantheline Bromide

International Brand NamesErcoril (DK); Ercotina (SE); Pro-Banthine (AU, BB, BE, BF, BJ, BM, BS, BZ, CI, CY, ET, FR, GB, GH, GM, GN, GY, HK, ID, IE, IN, JM, KE, LR, LU, MA, ML, MR, MU, MW, NE, NG, NL, SC, SD, SL, SN, SR, TN, TT, TW, TZ, UG, ZA, ZM, ZW); Propanline (TW)

Proparacaine and Fluorescein

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(proe PAR a kane & FLURE e seen)
U.S. Brand NamesFlucaine®; Fluoracaine® [DSC]
Pharmacologic CategoryDiagnostic Agent; Local Anesthetic
Use: Labeled IndicationsAnesthesia for tonometry, gonioscopy; suture removal from cornea; removal of corneal foreign body; cataract extraction, glaucoma surgery
Dosing: Adults

Ophthalmic surgery: Instill 1 drop in each eye every 5-10 minutes for 5-7 doses

Tonometry, gonioscopy, suture removal: Instill 1-2 drops in each eye just prior to procedure

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Ophthalmic surgery:** Children: Refer to adult dosing.
StorageStore in tight, light-resistant containers.
ContraindicationsHypersensitivity to proparacaine, fluorescein, any component of the formulation, or ester-type local anesthetics
Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.

- Hyperthyroidism: Use with caution in patients with hyperthyroidism.

Other warnings/precautions:

- Appropriate use: For topical ophthalmic use only; prolonged use not recommended.

Pregnancy Risk FactorC
Adverse Reactions

1% to 10%: Local: Burning, stinging of eye

<1%: Allergic contact dermatitis, irritation, sensitization, erosion of the corneal epithelium, conjunctival congestion and hemorrhage, keratitis, iritis, corneal opacification

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, ophthalmic: Proparacaine hydrochloride 0.5% and fluorescein sodium 0.25% (5 mL)

Flucaine®, Fluoracaine® [DSC]: Proparacaine hydrochloride 0.5% and fluorescein sodium 0.25% (5 mL)

Generic AvailableYes
Mechanism of ActionPrevents initiation and transmission of impulse at the nerve cell membrane by decreasing ion permeability through stabilizing
Pharmacodynamics/Kinetics

Onset of action: ~20 seconds

Duration: 15-20 minutes

Related Information

- Fluorescein

Medication Safety Issues

Sound-alike/look-alike issues:

Diprivan® may be confused with Diflucan®, Ditropan®

Propofol may be confused with fospropofol

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(PROE po fole)

U.S. Brand NamesDiprivan®

Canadian Brand NamesDiprivan®

Pharmacologic CategoryGeneral Anesthetic

Use: Labeled IndicationsInduction of anesthesia for inpatient or outpatient surgery in patients ≥3 years of age; maintenance of anesthesia for inpatient or outpatient surgery in patients >2 months of age; in adults, for induction and maintenance of monitored anesthesia care sedation during procedures; sedation in intubated, mechanically-ventilated ICU patients

Use: Unlabeled/InvestigationalPostoperative antiemetic; refractory delirium tremens (case reports); moderate sedation (conscious sedation)

Dosing: AdultsDosage must be individualized based on total body weight and titrated to the desired clinical effect. Wait at least 3-5 minutes between dosage adjustments to clinically assess drug effects. Smaller doses are required when used with narcotics. The following are general dosing guidelines (see “Abbreviations” section in front section for explanation of ASA-PS classes):

Induction:

General anesthesia:

Healthy adults, ASA-PS 1 or 2, <55 years: I.V.: 2-2.5 mg/kg (~40 mg every 10 seconds until onset of induction)

Debilitated, ASA-PS 3 or 4: Refer to elderly dosing.

Cardiac anesthesia: I.V.: 0.5-1.5 mg/kg (~20 mg every 10 seconds until onset of induction)

Neurosurgical patients: I.V.: 1-2 mg/kg (~20 mg every 10 seconds until onset of induction)

Maintenance:

General anesthesia:

Healthy adults, ASA-PS 1 or 2, <55 years:

I.V. infusion: Initial: 100-200 mcg/kg/minute for 10-15 minutes; decrease by 30% to 50% during first 30 minutes of maintenance; usual infusion rate: 50-100 mcg/kg/minute to optimize recovery time.

I.V. intermittent bolus: 25-50 mg increments as needed

Debilitated, ASA-PS 3 or 4: I.V. Infusion: Refer to elderly dosing.

Cardiac anesthesia: I.V. infusion:

Low-dose propofol with primary opioid: 50-100 mcg/kg/minute (see manufacturer's labeling)

Primary propofol with secondary opioid: 100-150 mcg/kg/minute

Neurosurgical patients: I.V. infusion: 100-200 mcg/kg/minute

Monitored anesthesia care sedation:

Initiation:

Healthy adults, ASA-PS 1 or 2, <55 years: Slow I.V. infusion: 100-150 mcg/kg/minute for 3-5 minutes **or** slow injection: 0.5 mg/kg over 3-5 minutes

Debilitated, neurosurgical, or ASA-PS 3 or 4 patients: Use 80% of healthy adult dose; **do not use rapid bolus doses (single or repeated)**

Maintenance:

Healthy adults, ASA-PS 1 or 2, <55 years: I.V. infusion using variable rates (preferred over intermittent boluses): 25-75 mcg/kg/minute **or** incremental bolus doses: 10 mg or 20 mg

Debilitated, neurosurgical, or ASA-PS 3 or 4 patients: Use 80% of healthy adult dose; **do not use rapid bolus doses (single or repeated)**

ICU sedation in intubated mechanically-ventilated patients: Avoid rapid bolus injection; individualize dose and titrate to response

Continuous infusion: Initial: 5 mcg/kg/minute; increase by 5-10 mcg/kg/minute every 5-10 minutes until desired sedation level is achieved; usual maintenance (Jacobi, 2002): 5-80 mcg/kg/minute. Elderly, debilitated, or ASA-PS 3 or 4 patients: Refer to elderly dosing. Daily interruption with retitration is recommended to minimize prolonged sedative effects (Jacobi, 2002).

Refractory status epilepticus (unlabeled use): 1-2 mg/kg bolus, then 1.5-10 mg/kg/hour (intubation required)

Dosing: Elderly

General anesthesia:

Induction: Elderly, debilitated, ASA-PS 3 or 4: I.V.: 1-1.5 mg/kg (~20 mg every 10 seconds until onset of induction); **do not use rapid bolus doses (single or repeated)**

Maintenance: Elderly, debilitated, ASA-PS 3 or 4: I.V. infusion: 50-100 mcg/kg/minute

Monitored anesthesia care sedation:

Initiation: Elderly, debilitated, ASA-PS 3 or 4, neurosurgical: I.V.: Use 80% of healthy adult dose; **do not use rapid bolus doses (single or repeated)**

Maintenance: Elderly, debilitated, ASA-PS 3 or 4, neurosurgical: I.V.: Use 80% of healthy adult dose; **do not use rapid bolus doses (single or repeated)**

ICU sedation in intubated mechanically-ventilated patients: Avoid rapid bolus injection; individualize dose and titrate to response: Continuous infusion: Elderly, debilitated, ASA-PS 3 or 4: Use 80% of healthy adult dose; reduce dose after adequate sedation established and adjust to response (eg, evaluate frequently to use minimum dose for sedation). Daily interruption with retitration is recommended to minimize prolonged sedative effects (Jacobi, 2002).

Dosing: PediatricDosage must be individualized based on total body weight and titrated to the desired clinical effect; wait at least 3-5 minutes between dosage adjustments to clinically assess drug effects; smaller doses are required when used with narcotics; the following are general dosing guidelines (see “Abbreviations” section in front section for explanation of ASA-PS classes):

General anesthesia:

Induction: I.V.: Healthy children 3-16 years, ASA-PS 1 or 2: 2.5-3.5 mg/kg over 20-30 seconds; use a lower dose for children ASA-PS 3 or 4

Maintenance: I.V. infusion: Healthy children 2 months to 16 years, ASA-PS 1 or 2: Initial: 200-300 mcg/kg/minute; after 30 minutes, if clinical signs of light anesthesia are absent, decrease the infusion rate; usual infusion rate: 125-150 mcg/kg/minute (range: 125-300 mcg/kg/minute); children ≤5 years may require larger infusion rates compared to older children

Calculations

- Propofol

Administration: I.V. Strict aseptic technique must be maintained in handling although a preservative has been added. Do not use if contamination is suspected. Do not administer through the same I.V. catheter with blood or plasma. Tubing and any unused portions of propofol vials should be discarded after 12 hours.

To reduce pain associated with injection, use larger veins of forearm or antecubital fossa; lidocaine I.V. (1 mL of a 1% solution) may also be used prior to administration or it may be added to propofol immediately before administration in a quantity not to exceed 20 mg lidocaine per 200 mg propofol. Do not use filter <5 micron for administration.

Administration: I.V. DetailpH: 7.0-8.5

Dietary ConsiderationsPropofol is formulated in an oil-in-water emulsion. If on parenteral nutrition, may need to adjust the amount of lipid infused. Propofol emulsion contains 1.1 kcal/mL. Soybean fat emulsion is used as a vehicle for propofol. Formulations also contain egg phosphatide and glycerol.

StorageStore between 4°C to 22°C (40°F to 72°F); refrigeration is not required. Do not freeze. Protect from light. If transferred to a syringe or other container prior to administration, use within 6 hours. If used directly from vial/prefilled syringe, use within 12 hours. Shake well before use. Do not use if there is evidence of separation of phases of emulsion.

ReconstitutionDoes not need to be diluted; however, propofol may be further diluted in 5% dextrose in water to a concentration of ≥2 mg/mL and is stable for 8 hours at room temperature.

CompatibilityStable in D_5W. Do not mix with other therapeutic agents prior to administration.

Y-site administration: Compatible I.V. solutions: D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5W, LR. **Compatible:** Acyclovir, alfentanil, aminophylline, ampicillin, atropine, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dexamethasone sodium phosphate, dexmedetomidine, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, ifosfamide, imipenem/cilastatin, inamrinone, insulin (regular), isoproterenol, ketamine, labetalol, levorphanol, lorazepam, magnesium sulfate, mannitol, meperidine, midazolam, milrinone, nafcillin, nalbuphine, naloxone, nitroglycerin, norepinephrine, ofloxacin, paclitaxel, pancuronium, pentobarbital, phenobarbital, phenylephrine, piperacillin, potassium chloride, prochlorperazine edisylate, propranolol, ranitidine, scopolamine, sodium bicarbonate, sodium nitroprusside, succinylcholine, sufentanil, thiopental, ticarcillin, ticarcillin/clavulanate potassium, vancomycin, vecuronium. **Incompatible:** Amikacin, amphotericin B, atracurium, calcium chloride, ciprofloxacin, diazepam, digoxin, doripenem, doxacurium, doxorubicin, gentamicin, levofloxacin, methotrexate, methylprednisolone sodium succinate, metoclopramide, minocycline, mitoxantrone, pantoprazole, phenytoin, tobramycin, verapamil. **Variable (consult detailed reference):** Ascorbic acid, ceftazidime, cisatracurium, doxacurium, lidocaine, morphine.

Compatibility in syringe: Compatible: Ondansetron, thiopental. **Note:** Manufacturers recommend that propofol not be mixed with any other therapeutic agents prior to administration.

ContraindicationsHypersensitivity to propofol or any component of the formulation; hypersensitivity to eggs, egg products, soybeans, or soy products

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: May rarely cause hypersensitivity, anaphylaxis, anaphylactoid reactions, angioedema, bronchospasm, and erythema; medications for the treatment of hypersensitivity reactions should be available for immediate use.

- Hypertriglyceridemia: Because propofol is formulated within a 10% fat emulsion, hypertriglyceridemia is an expected side effect. Patients who develop hypertriglyceridemia (eg, >500 mg/dL) are at risk of developing pancreatitis. Serum triglyceride levels should be obtained prior to initiation of therapy and every 3-7 days thereafter. Monitoring of serum triglycerides should especially be considered with therapy >48 hours with doses exceeding 50 mcg/kg/minute (Devlin, 2005). An alternative sedative agent should be employed if significant hypertriglyceridemia occurs. Use with caution in patients with preexisting hyperlipidemia as evidenced by increased serum triglyceride levels or serum turbidity.

- Hypotension: The major cardiovascular effect of propofol is hypotension especially if patient is hypovolemic or if bolus dosing is used. Hypotension may be substantial with a reduction in mean arterial pressure occasionally exceeding 30%. Use with caution in patients who are hemodynamically unstable, hypovolemic, or have abnormally low vascular tone (eg, sepsis).

- Injection-site reaction: Transient local pain may occur during I.V. injection; lidocaine 1% solution may be administered prior to administration or may be added to propofol immediately prior to administration to reduce pain associated with injection (see Administration).

- Myoclonus: Perioperative myoclonus (eg, convulsions and opisthotonos) has occurred with administration.

- Propofol-related infusion syndrome (PRIS): PRIS is a serious side effect with a high mortality rate characterized by dysrhythmia (eg, bradycardia or tachycardia), heart failure, hyperkalemia, lipemia, metabolic acidosis, and/or rhabdomyolysis or myoglobinuria with subsequent renal failure. Risk factors include poor oxygen delivery, sepsis, serious cerebral injury, and the administration of high doses of propofol (usually doses >83 mcg/kg/minute or >5 mg/kg/hour for >48 hours), but has also been reported following large dose, short-term infusions during surgical anesthesia. The onset of the syndrome is rapid, occurring within 4 days of initiation. The mechanism of the syndrome has yet to be determined. Alternate sedative therapy should be considered for patients with escalating doses of vasopressors or inotropes, when cardiac failure occurs during high-dose propofol infusion, when metabolic acidosis is observed, or in whom lengthy and/or high-dose sedation is needed (Jacobi, 2002; Corbett, 2008).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiac disease (ejection fraction <50%) or hypotension; may have more profound adverse cardiovascular responses to propofol.

- Increased intracranial pressure: Use with caution in patients with increased intracranial pressure or impaired cerebral circulation; substantial decreases in mean arterial pressure and subsequent decreases in cerebral perfusion pressure may occur; consider continuous infusion or administer as a slow bolus.

- Infection risk: Propofol vials and prefilled syringes have the potential to support the growth of various microorganisms despite product additives intended to suppress microbial growth. To limit the potential for contamination, strictly adhere to recommendations in product labeling for handling and administering propofol.

- Pancreatitis: Use with caution in patients with preexisting pancreatitis; use of propofol may exacerbate this condition.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients with a history of epilepsy or seizures; seizure may occur during recovery phase

Concurrent drug therapy issues:

- Opiates: Concomitant use may lead to increased sedative or anesthetic effects of propofol, more pronounced decreases in systolic, diastolic, and mean arterial pressures and cardiac output. Lower doses of propofol may be needed. In addition, fentanyl may cause serious bradycardia when used with propofol in pediatric patients. Alfentanil use with propofol has precipitated seizure activity in patients without any history of epilepsy.

Special populations:

- ASA-PS (American Society of Anesthesiologists - Physical Status) 3/4 patients: Use a lower induction dose, a slower maintenance rate of administration, and avoid rapidly delivered boluses in ASA-PS 3/4 patients to reduce the incidence of unwanted cardiorespiratory depressive events.

- Debilitated patients: Use a lower induction dose, a slower maintenance rate of administration, and avoid rapidly delivered boluses in debilitated patients to reduce the incidence of unwanted cardiorespiratory depressive events.

- Elderly: Use a lower induction dose, a slower maintenance rate of administration, and avoid rapidly delivered boluses in the elderly to reduce the incidence of unwanted cardiorespiratory depressive events.

- Pediatrics: Safety and efficacy have not been established in pediatric intensive care unit patients; concurrent use of fentanyl and propofol in pediatric patients may result in bradycardia.

- Pregnancy: Propofol should only be used in pregnancy if clearly needed. Not recommended for use in obstetrics, including cesarean section deliveries.

Dosage form specific issues:

- Benzyl alcohol: Some products may contain benzyl alcohol which has been associated with the "gasping syndrome" in neonates.

- Edetate disodium: Some formulations contain edetate disodium which may lead to decreased zinc levels in patients with prolonged therapy (>5 days) or a predisposition to zinc deficiency (eg, burns, diarrhea, or sepsis). A holiday from propofol infusion should take place after 5 days of therapy to allow for evaluation and necessary replacement of zinc.

- Sulfites: Some formulations may contain sulfites.

Other warnings/precautions:

- Abrupt discontinuation: Avoid abrupt discontinuation prior to weaning or daily wake up assessments. Abrupt discontinuation can result in rapid awakening, anxiety, agitation, and resistance to mechanical ventilation; wean the infusion rate so the patient awakens slowly. Discontinue opioids and paralytic agents prior to weaning. Long-term infusions can result in some tolerance; taper propofol infusions to prevent withdrawal.

- Analgesic supplementation: Propofol lacks analgesic properties; pain management requires specific use of analgesic agents, at effective dosages, propofol must be titrated separately from the analgesic agent.

- Experienced personnel: Use requires careful patient monitoring, should only be used by experienced personnel who are not actively engaged in the procedure or surgery. If used in a nonintubated and/or nonmechanically-ventilated patient, qualified personnel and appropriate equipment for rapid institution of respiratory and/or cardiovascular support must be immediately available. Use to induce moderate (conscious) sedation in patients warrants monitoring equivalent to that seen with deep anesthesia.

Pregnancy Risk FactorB

Pregnancy ConsiderationsPropofol should only be used in pregnancy if clearly needed. Propofol is not recommended for obstetrics, including cesarean section deliveries. Propofol crosses the placenta and may be associated with neonatal CNS and respiratory depression.

LactationEnters breast milk/not recommended

Adverse Reactions

>10%:

Cardiovascular: Hypotension (children 17%; adults 3% to 26%)

Central nervous system: Movement (children 17%; adults 3% to 10%)

Local: Injection site burning, stinging, or pain (children 10%; adults 18%)

Respiratory: Apnea lasting 30-60 seconds (children 10%; adults 24%), apnea lasting >60 seconds (children 5%; adults 12%)

1% to 10%:

Cardiovascular: Hypertension (children 8%), arrhythmia (1% to 3%), bradycardia (1% to 3%), cardiac output decreased (1% to 3%; concurrent opioid use increases incidence), tachycardia (1% to 3%)

Dermatologic: Pruritus (1% to 3%), rash (children 5%; adults 1% to 3%)

Endocrine & metabolic: Hypertriglyceridemia (3% to 10%)

Respiratory: Respiratory acidosis during weaning (3% to 10%)

<1%, postmarketing, and/or case reports: Agitation, amblyopia, anaphylaxis, anaphylactoid reaction, anticholinergic syndrome, asystole, atrial arrhythmia, bigeminy, cardiac arrest, chills, cough, dizziness, delirium, discoloration (green [urine, hair, or nailbeds]), extremity pain, fever, flushing, hemorrhage, hypersalivation, hypertonia, hypomagnesemia, hypoxia, infusion site reactions (including pain, swelling, blisters and/or tissue necrosis following accidental extravasation); laryngospasm, leukocytosis, lung function decreased, myalgia, myoclonia (rarely including convulsions and opisthotonos), nausea, pancreatitis, paresthesia, phlebitis, postoperative unconsciousness with or without increase in muscle tone, premature atrial contractions, premature ventricular contractions, pulmonary edema, propofol-related infusion syndrome (see Note), rhabdomyolysis, somnolence, syncope, thrombosis, urine cloudy, vision abnormality, wheezing

Note: Propofol-related infusion syndrome (PRIS) is a serious side effect with a high mortality rate characterized by dysrhythmia (eg, bradycardia or tachycardia), heart failure, hyperkalemia, lipemia, metabolic acidosis, and/or rhabdomyolysis or myoglobinuria with subsequent renal failure.

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (major), 2C9 (major), 2C19 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (moderate), 2C9 (weak), 2C19 (moderate), 2D6 (weak), 2E1 (weak), 3A4 (strong)

Drug Interactions

Alfentanil: May enhance the adverse/toxic effect of Propofol. Specifically the development of opisthotonus (severe hyperextension and spasticity resulting in arching or bridging position) and/or grand mal seizures. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

Ropivacaine: Propofol may increase the serum concentration of Ropivacaine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Edetate disodium, an ingredient of propofol emulsion, may lead to decreased zinc levels in patients on prolonged therapy (>5 days) or those predisposed to deficiency (burns, diarrhea, and/or major sepsis).

Monitoring ParametersCardiac monitor, blood pressure, oxygen saturation (during monitored anesthesia care sedation), arterial blood gas (with prolonged infusions). With prolonged infusions (eg, ICU sedation), monitor for metabolic acidosis, hyperkalemia, rhabdomyolysis or elevated CPK, hepatomegaly, and progression of cardiac and renal failure.

ICU sedation: Assess and adjust sedation according to scoring system; assess CNS function daily. Serum triglyceride levels should be obtained prior to initiation of therapy and every 3-7 days thereafter, especially if receiving for >48 hours with doses exceeding 50 mcg/kg/minute (Devlin, 2005); use intravenous port opposite propofol infusion or temporarily suspend infusion and flush port prior to blood draw.

Diprivan®: Monitor zinc levels in patients predisposed to deficiency (burns, diarrhea, major sepsis) or after 5 days of treatment.

Nursing: Physical Assessment/MonitoringDosage and rate of administration should be individualized and titrated to the desired effect, according to relevant clinical factors, premedication, concomitant medications, age, and general condition of patient. Assess other medications for effectiveness and safety. Other drugs that cause CNS depression may increase CNS depression induced by propofol (monitor and adjust dosage as necessary). Continuous monitoring of vital signs, cardiac and respiratory status, and level of sedation is mandatory during infusion and until full consciousness is regained. Safety precautions must be maintained until patient is fully alert. Propofol is an anesthetic; pain must be treated with appropriate analgesic agents. Do not discontinue abruptly (may result in rapid awakening associated with anxiety, agitation, and resistance to mechanical ventilation). Titrate infusion rate so patient awakes slowly. **Note:** After long-term administration, it will take longer for reduction of propofol levels than if propofol is used for short-term anesthesia. For long-term use, monitor fluid levels (intake and output) during and following infusion (urine will be green). Reposition patient and provide appropriate skin care, mouth care, and care of patient's eyes every 2-3 hours while sedated. Provide appropriate emotional and sensory support (auditory and environmental).

Monitoring: Lab TestsWith prolonged infusions (eg, ICU sedation), arterial blood gases, potassium, CPK, AST and ALT, BUN, creatinine.

Serum triglyceride levels should be obtained prior to initiation of therapy (ICU setting) and every 3-7 days thereafter, especially if receiving for >48 hours with doses exceeding 50 mcg/kg/minute (Devlin, 2005); use intravenous port opposite propofol infusion or temporarily suspend infusion and flush port prior to blood draw.

Diprivan®: Monitor zinc levels in patients predisposed to deficiency (burns, diarrhea, major sepsis) or after 5 days of treatment.

Patient EducationThis is an anesthetic. Patient education should be appropriate to individual situation. With long-term use appropriate emotional and sensory support is strongly recommended. Following return of consciousness, do not attempt to change position or rise from bed without assistance. Flu-like symptoms (chills, fever, body aches) have been reported for up to 3 days following receiving medication; contact prescriber if symptoms occur. Report immediately any pounding or unusual heartbeat, respiratory difficulty, or acute dizziness. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, emulsion: 10 mg/mL (20 mL, 50 mL, 100 mL) [products may contain egg lecithin, and soybean oil; may contain benzyl alcohol, sodium benzoate, or sodium metabisulfite]

Diprivan®: 10 mg/mL (20 mL, 50 mL, 100 mL) [contains egg lecithin, soybean oil, and disodium edetate]

Generic AvailableYes

ManufacturerAstraZeneca Pharmaceuticals LP

Mechanism of ActionPropofol is a sterically hindered, alkyl-phenolic compound with intravenous general anesthetic properties. The drug is unrelated to any of the currently used barbiturate, opioid, benzodiazepine, arylcyclohexylamine, or imidazole intravenous anesthetic agents.

Pharmacodynamics/Kinetics

Onset of action: Anesthetic: Bolus infusion (dose dependent): 9-51 seconds (average 30 seconds)

Duration (dose and rate dependent): 3-10 minutes

Distribution: V_d: 2-10 L/kg; after a 10-day infusion, V_d approaches 60 L/kg; decreased in the elderly

Protein binding: 97% to 99%

Metabolism: Hepatic to water-soluble sulfate and glucuronide conjugates (~50%)

Half-life elimination: Biphasic: Initial: 40 minutes; Terminal: 4-7 hours (after 10-day infusion, may be up to 1-3 days)

Excretion: Urine (~88% as metabolites, 40% as glucuronide metabolite); feces (<2%)

Related Information

- Status Epilepticus

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive CNS depression and respiratory depression; monitor and adjust dosages as needed

Cardiovascular Considerations**Hemodynamic effects:** The major cardiovascular effect of propofol is hypotension especially if patient is hypovolemic or if bolus dosing is used. Hypotension may be substantial with a reduction in mean arterial pressure occasionally exceeding

30%. Propofol may also exert a direct negative inotropic effect in nonfailing and failing myocardium especially with concurrent opioid use (eg, fentanyl). In mechanically ventilated patients, the degree of negative inotropic effects may be exaggerated if positive pressure ventilation is employed. Use caution in patients with ejection fraction (EF) <50%. Bradycardia may also occur with administration especially with concurrent fentanyl administration.

Medication Safety Issues

Sound-alike/look-alike issues:

Darvocet-N® may be confused with Darvon-N®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(proe POKS i feen & a seet a MIN oh fen)

U.S. Brand NamesBalacet 325™; Darvocet A500®; Darvocet-N® 100; Darvocet-N® 50

Canadian Brand NamesDarvocet-N® 100; Darvocet-N® 50

Pharmacologic CategoryAnalgesic Combination (Opioid)

Use: Labeled IndicationsManagement of mild to moderate pain

Use: DentalManagement of postoperative pain

Dosing: Adults

Pain management: Oral:

Darvocet A500®, Darvocet-N® 100: 1 tablet every 4 hours as needed; maximum: 600 mg propoxyphene napsylate/day

Darvocet-N® 50: 1-2 tablets every 4 hours as needed; maximum: 600 mg propoxyphene napsylate/day

Propoxyphene hydrochloride 65 mg and acetaminophen 650 mg: 1 tablet every 4 hours as needed; maximum: 390 mg/day propoxyphene hydrochloride, 4 g/day acetaminophen)

Note: Formulations contain significant amounts of acetaminophen; intake should be limited to <4 g acetaminophen/day (less in patients with hepatic impairment/ethanol abuse)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentSerum concentrations of propoxyphene may be increased or elimination may be delayed; specific dosing recommendations not available.

Dosing: Hepatic ImpairmentSerum concentrations of propoxyphene may be increased or elimination may be delayed; specific dosing recommendations not available.

Administration: OralShould be administered with water on an empty stomach.

Dietary ConsiderationsMay be taken with food if gastrointestinal distress occurs.

StorageStore at controlled room temperature.

RestrictionsC-IV

ContraindicationsHypersensitivity to propoxyphene, acetaminophen, or any component of the formulation

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

• Drug-related deaths: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

• CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

• Drug-related deaths: **[U.S. Boxed Warning]: When given in excessive doses, either alone or in combination with other CNS depressants (including alcohol), propoxyphene is a major cause of drug-related deaths; recommended dosage must not be exceeded and alcohol intake should be limited.**

• Hepatotoxicity: Acetaminophen may cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Depression: Should not be prescribed in patients who severely depressed or suicidal.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- G6PD deficiency: Use with caution in patients with known G6PD deficiency.
- Hepatic impairment: Use propoxyphene with caution in patients with hepatic impairment; consider dosing adjustment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use propoxyphene with caution in patients with renal impairment; consider dosing adjustment.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use propoxyphene with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatrics: Safety and efficacy have not been established in children of this combination product.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day.
- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics; do not exceed 4 g/day of acetaminophen. See Warnings/Precautions and Dosage. Propoxyphene is not considered the analgesic of choice in the elderly patient when mild-to-moderate pain requires a narcotic analgesic. This is due to the higher incidence of adverse CNS effects seen in this population group. The addiction potential is also a concern; avoid use, if possible.

Pregnancy Risk FactorC

Pregnancy ConsiderationsWithdrawal symptoms have been reported in the neonate following propoxyphene use during pregnancy. Teratogenic effects have also been noted in case reports. Opioid analgesics are considered pregnancy risk factor D if used for prolonged periods or in large doses near term.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsPropoxyphene, norpropoxyphene and acetaminophen are excreted in breast milk. The AAP considers propoxyphene and acetaminophen to be “compatible” with breast-feeding.

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Propoxyphene: **Inhibits** CYP2C9 (weak), 2D6 (weak), 3A4 (weak)

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Beta-Blockers: Propoxyphene may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

CarBAMazepine: Propoxyphene may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: Propoxyphene may enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Tricyclic Antidepressants: Propoxyphene may enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Propoxyphene may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Based on **propoxyphene** component:

Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Food: May decrease rate of absorption, but may slightly increase bioavailability.

Based on **acetaminophen** component:

Ethanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Food: Rate of absorption may be decreased when given with food.

Herb/Nutraceutical: St John's wort may decrease acetaminophen levels.

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, 50/325:

Darvocet-N® 50: Propoxyphene napsylate 50 mg and acetaminophen 325 mg

Tablet, 65/650: Propoxyphene hydrochloride 65 mg and acetaminophen 650 mg

Tablet, 100/325:

Balacet 325™: Propoxyphene napsylate 100 mg and acetaminophen 325 mg

Tablet, 100/500: Propoxyphene hydrochloride 100 mg and acetaminophen 500 mg

Mechanism of Action

Propoxyphene is a weak narcotic analgesic which acts through binding to opiate receptors to inhibit ascending pain pathways

Propoxyphene, as with other narcotic (opiate) analgesics, blocks pain perception in the cerebral cortex by binding to specific receptor molecules (opiate receptors) within the neuronal membranes of synapses. This binding results in a decreased synaptic chemical transmission throughout the CNS thus inhibiting the flow of pain sensations into the higher centers. Mu and kappa are the two subtypes of the opiate receptor to which propoxyphene binds to cause analgesia.

Acetaminophen inhibits the synthesis of prostaglandins in the CNS and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Acetaminophen
- Propoxyphene

Pharmacotherapy PearlsSome studies have found no significant difference in pain relief between propoxyphene and aspirin or acetaminophen.

Dental Health Professional ConsiderationsPropoxyphene is a narcotic analgesic and shares many properties including addiction liability. The acetaminophen component requires use with caution in patients with alcoholic liver disease.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness, drowsiness, insomnia, and paradoxical excitement are common; may cause nervousness, restlessness, confusion; may rarely cause depression or hallucinations

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation as well as increase their serum levels; monitor for altered clinical response or preferably, use a different analgesic

Index TermsAcetaminophen and Propoxyphene; Propoxyphene Hydrochloride and Acetaminophen; Propoxyphene Napsylate and Acetaminophen

Medication Safety Issues

Sound-alike/look-alike issues:

Darvon® may be confused with Devrom®, Diovan®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(proe POKS i feen, AS pir in, & KAF een)

U.S. Brand NamesDarvon® Compound [DSC]

Pharmacologic CategoryAnalgesic Combination (Opioid)

Use: Labeled IndicationsTreatment of mild-to-moderate pain

Use: DentalTreatment of mild-to-moderate pain

Dosing: Adults**Pain:** Oral: One capsule (providing propoxyphene 65 mg) every 4 hours as needed; maximum propoxyphene 390 mg/day. This will also provide aspirin 389 mg and caffeine 32.4 mg per capsule.

Dosing: ElderlyRefer to adult dosing. Consider increasing dosing interval.

Dosing: Renal ImpairmentSerum concentrations of propoxyphene may be increased or elimination may be delayed; specific dosing recommendations not available. Avoid use with Cl_{cr} <10 mL/minute.

Dosing: Hepatic ImpairmentSerum concentrations or propoxyphene may be increased or elimination may be delayed; specific dosing recommendations not available.

Calculations

- Creatinine Clearance: Adults

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsC-IV

ContraindicationsHypersensitivity to propoxyphene, aspirin, caffeine, or any component of the formulation

Allergy Considerations

- Opioid Allergy/Hypersensitivity
- Salicylate Allergy/Sensitivity

Warnings/Precautions

Boxed warnings:

- Drug-related deaths: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Drug-related deaths: **[U.S. Boxed Warning]: When given in excessive doses, either alone or in combination with other CNS depressants (including alcohol), propoxyphene is a major cause of drug-related deaths; recommended dosage must not be exceeded and alcohol intake should be limited.**

- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.

- Bleeding disorders: Use aspirin with caution in patients with platelet and bleeding disorders.

- Depression: Should not be prescribed in patients who severely depressed or suicidal.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Ethanol use: Heavy ethanol use (>3 drinks/day) can increase bleeding risks of aspirin.

- Gastrointestinal disease: Use aspirin with caution in patients with erosive gastritis or peptic ulcer disease.

- Hepatic impairment: Use propoxyphene with caution in patients with hepatic impairment; consider dosing adjustment.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Renal impairment: Use propoxyphene with caution in patients with renal impairment; consider dosing adjustment.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use propoxyphene with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established in children of this combination product. Aspirin should be avoided in children (<16 years of age) with viral infections (chickenpox or flu symptoms), with or without fever, due to a potential association with Reye's syndrome.

- Surgical patients: ASA should be avoided (if possible) in surgical patients for 1-2 weeks prior to surgery, to reduce the risk of excessive bleeding.

Other warnings/precautions:

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Pregnancy Risk FactorC

Pregnancy ConsiderationsWithdrawal symptoms have been reported in the neonate following propoxyphene use during pregnancy. Teratogenic effects have also been noted in case reports. Opioid analgesics are considered pregnancy risk factor D if used for prolonged periods or in large doses near term. Full doses of aspirin during pregnancy may lead to adverse effects in the fetus and mother; exposure late in pregnancy may lead to premature closure of the ductus arteriosus. Moderate amounts of dietary caffeine during pregnancy are not expected to cause harm to the fetus; use of high doses are not recommended.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsPropoxyphene, norpropoxyphene, aspirin, and caffeine are excreted in breast milk. The AAP recommends that aspirin be used “with caution” during breast-feeding; propoxyphene and caffeine (moderate intake) are considered “compatible.”

Adverse ReactionsSee individual agents for Propoxyphene and Aspirin.

Metabolism/Transport EffectsSee individual agents.

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Propoxyphene may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

CarBAMazepine: Propoxyphene may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

MAO Inhibitors: Propoxyphene may enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Propoxyphene may enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Propoxyphene may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsBased on **propoxyphene** component:

Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Food: May decrease rate of absorption, but may slightly increase bioavailability.

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule (Darvon® Compound 65): Propoxyphene hydrochloride 65 mg, aspirin 389 mg, and caffeine 32.4 mg [DSC]

Generic AvailableNo

ManufactureraaiPharma

Mechanism of ActionPropoxyphene is a weak narcotic analgesic which acts through binding to opiate receptors to inhibit ascending pain pathways. Propoxyphene, as with other narcotic (opiate) analgesics, blocks pain perception in the cerebral cortex by binding to specific receptor molecules (opiate receptors) within the neuronal membranes of synapses. This binding results in a decreased synaptic chemical transmission throughout the CNS thus inhibiting the flow of pain sensations into the higher centers. Mu and kappa are the two subtypes of the opiate receptor to which propoxyphene binds to cause analgesia.

Aspirin inhibits prostaglandin synthesis, acts on the hypothalamus heat-regulating center to reduce fever, blocks prostaglandin synthetase action which prevents formation of the platelet-aggregating substance thromboxane A_2.

Caffeine is a CNS stimulant; use with propoxyphene and aspirin increases the level of analgesia provided by each agent.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Aspirin
- Propoxyphene

Dental Health Professional ConsiderationsPropoxyphene is a narcotic analgesic and shares many properties including addiction liability. The aspirin component could have anticoagulant effects and could possibly affect bleeding times.

There is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin’s antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin’s platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose-related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness, drowsiness, insomnia, and paradoxical excitement are common; may cause nervousness, restlessness, confusion; may rarely cause depression or hallucinations

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation as well as increase their serum levels; monitor for altered clinical response or preferably, use a different analgesic

Index TermsAspirin, Caffeine, and Propoxyphene; Caffeine, Propoxyphene, and Aspirin; Propoxyphene Hydrochloride, Aspirin, and Caffeine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Propoxyphene may be confused with proparacaine

Darvon® may be confused with Devrom®, Diovan®

Darvon-N® may be confused with Darvocet-N®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(proe POKS i feen)

U.S. Brand NamesDarvon-N®; Darvon®

Canadian Brand Names642® Tablet; Darvon-N®

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsManagement of mild to moderate pain

Dosing: Adults**Pain management:** Oral:

Hydrochloride: 65 mg every 3-4 hours as needed for pain; maximum: 390 mg/day

Napsylate: 100 mg every 4 hours as needed for pain; maximum: 600 mg/day

Dosing: ElderlyPain management: Oral:

Hydrochloride: 65 mg every 4-6 hours as needed for pain

Napsylate: 100 mg every 4-6 hours as needed for pain

Dosing: Pediatric**Pain management:** Oral: Children: Doses for children are not well established; doses of the hydrochloride of 2-3 mg/kg/d divided every 6 hours have been used.

Dosing: Renal ImpairmentSerum concentrations of propoxyphene may be increased or elimination may be delayed. Avoid use in Cl_{cr} <10 mL/minute. Specific dosing recommendations not available for less severe impairment.

Not dialyzable (0% to 5%)

Dosing: Hepatic ImpairmentSerum concentrations of propoxyphene may be increased or elimination may be delayed. Specific dosing recommendations not available.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Opioid Agonist Conversion

Administration: OralShould be administered with glass of water on an empty stomach. Food may decrease rate of absorption, but may slightly increase bioavailability.

Dietary ConsiderationsMay administer with food if gastrointestinal distress occurs.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsC-IV

ContraindicationsHypersensitivity to propoxyphene or any component of the formulation

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

• Drug-related deaths: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

• CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Drug-related deaths: **[U.S. Boxed Warning]: When given in excessive doses, either alone or in combination with other CNS depressants (including alcohol), propoxyphene is a major cause of drug-related deaths; recommended dosage must not be exceeded and alcohol intake should be limited.**
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Depression: Should not be prescribed in patients who severely depressed or suicidal.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment; consider dosing adjustment.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with renal impairment; consider dosing adjustment.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precaution:

- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.
- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsElderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics. Propoxyphene is not considered the analgesic of choice in the elderly when mild to moderate pain requires a narcotic analgesic. This is due to the higher incidence of adverse CNS effects seen in the elderly population. Also a concern is the addiction potential in elderly; avoid use, if possible.

Pregnancy Risk FactorC/D (prolonged use)

Pregnancy ConsiderationsWithdrawal symptoms have been reported in the neonate following propoxyphene use during pregnancy. Teratogenic effects have also been noted in case reports. Opioid analgesics are considered pregnancy risk factor D if used for prolonged periods or in large doses near term.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsPropoxyphene and norpropoxyphene are excreted in breast milk.

Adverse ReactionsFrequency not defined.

Cardiovascular: Bundle branch block, hypotension

Central nervous system: Confusion, dizziness, dysphoria, drowsiness, fatigue, hallucinations, headache, increased intracranial pressure, lightheadedness, malaise, mental depression, nervousness, paradoxical CNS stimulation, paradoxical excitement and insomnia, restlessness, sedation, vertigo

Dermatologic: Rash, urticaria

Endocrine & metabolic: Decreased urinary 17-OHCS, hypoglycemia

Gastrointestinal: Abdominal pain, anorexia, biliary spasm, constipation, nausea, paralytic ileus, stomach cramps, vomiting, xerostomia

Genitourinary: Decreased urination, ureteral spasms

Hepatic: LFTs increased, jaundice

Neuromuscular & skeletal: Weakness

Ocular: Visual disturbances

Respiratory: Dyspnea

Miscellaneous: Histamine release, hypersensitivity reaction psychologic and physical dependence with prolonged use

Metabolism/Transport Effects**Inhibits** CYP2C9 (weak), 2D6 (weak), 3A4 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Propoxyphene may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

CarBAMazepine: Propoxyphene may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

MAO Inhibitors: Propoxyphene may enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Tricyclic Antidepressants: Propoxyphene may enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Propoxyphene may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Food: May decrease rate of absorption, but may slightly increase bioavailability.

Test InteractionsFalse-positive methadone test
Monitoring ParametersPain relief, respiratory and mental status, blood pressure
Reference Range

Therapeutic: Ranges published vary between laboratories and may not correlate with clinical effect

Therapeutic concentration: 0.1-0.4 mcg/mL (SI: 0.3-1.2 µmol/L)

Toxic: >0.5 mcg/mL (SI: >1.5 µmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness, cardio/respiratory and CNS status, adverse reactions and signs of overdose at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationTake as directed; do not take a larger dose or more often than prescribed. Do not use alcohol, other prescription or OTC sedatives, tranquilizers, antihistamines, or pain medications without consulting prescriber. May cause dizziness, drowsiness, or impaired judgment; avoid driving or engaging in tasks requiring alertness until response to drug is known. If you experience vomiting or loss of appetite, frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help. Increased fluid intake, exercise, fiber in diet may help with constipation (if unresolved consult prescriber). Report unresolved nausea or vomiting, respiratory difficulty or shortness of breath, or unusual weakness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Mechanism of ActionPropoxyphene is a weak narcotic analgesic which acts through binding to opiate receptors to inhibit ascending pain pathways. Propoxyphene, as with other narcotic (opiate) analgesics, blocks pain perception in the cerebral cortex by binding to specific receptor molecules (opiate receptors) within the neuronal membranes of synapses. This binding results in a decreased synaptic chemical transmission throughout the CNS thus inhibiting the flow of pain sensations into the higher centers. Mu and kappa are the two subtypes of the opiate receptor which propoxyphene binds to cause analgesia.
Pharmacodynamics/Kinetics

Onset of action: 0.5-1 hour

Duration: 4-6 hours

Metabolism: Hepatic to active metabolite (norpropoxyphene) and inactive metabolites; first-pass effect

Half-life elimination: Adults: Parent drug: 6-12 hours; Norpropoxyphene: 30-36 hours

Excretion: Urine (primarily as metabolites)

Related Information

- Narcotic / Opioid Analgesics

Pharmacotherapy Pearls100 mg of napsylate = 65 mg of hydrochloride

Propoxyphene hydrochloride: Darvon®

Propoxyphene napsylate: Darvon-N®

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness, drowsiness, insomnia, and paradoxical excitement are common; may cause nervousness, restlessness, confusion; may rarely cause depression or hallucinations
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation as well as increase their serum levels; monitor for altered clinical response or preferably, use a different analgesic
Anesthesia and Critical Care Concerns/Other ConsiderationsEquivalent dosing: 100 mg of napsylate = 65 mg of hydrochloride
Index TermsDextropropoxyphene; Propoxyphene Hydrochloride; Propoxyphene Napsylate

Medication Safety Issues

Sound-alike/look-alike issues:

Inderide® may be confused with Inderal®

Pronunciation(proe PRAN oh lole & hye droe klor oh THYE a zide)
U.S. Brand NamesInderide®
Pharmacologic CategoryBeta Blocker, Nonselective; Diuretic, Thiazide
Use: Labeled IndicationsManagement of hypertension
Dosing: Adults

Hypertension: Oral: Dose is individualized; typical dosages of **hydrochlorothiazide**: 12.5-50 mg/day; initial dose of **propranolol** 80 mg/day

Note: Daily dose of tablet form should be divided into 2 daily doses; may be used to maximum dosage of up to 160 mg of propranolol; higher dosages would result in higher than optimal thiazide dosages.

Dosing: ElderlyRefer to adult dosing.
Allergy Considerations

- Beta-Blocker Allergy
- Thiazide/Thiazide-Related Diuretic Allergy

Geriatric ConsiderationsCombination products are not recommended for first-line therapy and divided doses of diuretics may increase the incidence of nocturia in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted for this combination. See individual agents.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsPropranolol: **Substrate** of CYP1A2 (major), 2C19 (major), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2D6 (weak)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alcohol (Ethyl): May decrease the serum concentration of Propranolol. Alcohol (Ethyl) may increase the serum concentration of Propranolol. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Fluvoxamine: May increase the serum concentration of Propranolol. Management: Use a lower initial propranolol dose and be cautious with propranolol dose titration. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Serotonin 5-HT1D Receptor Agonists: Propranolol may increase the serum concentration of Serotonin 5-HT1D Receptor Agonists. **Exceptions:** Almotriptan; Eletriptan; Frovatriptan; Naratriptan; SUMAtriptan; Zolmitriptan. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Zileuton: May increase the serum concentration of Propranolol. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Propranolol hydrochloride 40 mg and hydrochlorothiazide 25 mg; propranolol hydrochloride 80 mg and hydrochlorothiazide 25 mg

Inderide®: 40/25: Propranolol hydrochloride 40 mg and hydrochlorothiazide 25 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Inderide)

40-25 mg (60): $96.92

80-25 mg (60): $117.80

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Hydrochlorothiazide
- Propranolol

Dental Health: Effects on Dental TreatmentNoncardioselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine has interacted with nonselective beta-blockers to result in initial hypertensive episode followed by bradycardia
Mental Health: Effects on Mental StatusPropranolol may cause fatigue and malaise which are commonly mistaken for depression; may also cause dizziness, confusion, insomnia, or hallucinations
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropic drugs may produce additive hypotensive effects; monitor blood pressure. May decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels. Cutaneous reactions, including Stevens-Johnson syndrome, have been reported with use of propranolol; use caution with lamotrigine or valproic combination as combined usage with propranolol has been associated with these reactions.
Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for propranolol and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. See Cardiovascular Considerations for individual agents.
Index TermsHydrochlorothiazide and Propranolol

Medication Safety Issues

Sound-alike/look-alike issues:

Propranolol may be confused with Pravachol®, Propulsid®

Inderal® may be confused with Adderall®, Enduron®, Enduronyl®, Imdur®, Imuran®, Inderide®, Isordil®, Toradol®

Inderal® 40 may be confused with Enduronyl® Forte

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

International issues:

Inderal® may be confused with Indiaral® which is a brand name for loperamide in France

Pronunciation(proe PRAN oh lole)

U.S. Brand NamesInderal® [DSC]; Inderal® LA; InnoPran XL™

Canadian Brand NamesApo-Propranolol®; Dom-Propranolol; Inderal®; Inderal®-LA; Novo-Pranol; Nu-Propranolol; PMS-Propranolol; Propranolol Hydrochloride Injection, USP

Pharmacologic CategoryAntiarrhythmic Agent, Class II; Beta Blocker, Nonselective

Use: Labeled IndicationsManagement of hypertension; angina pectoris; pheochromocytoma; essential tremor; supraventricular arrhythmias (such as atrial fibrillation and flutter, AV nodal re-entrant tachycardias), ventricular tachycardias (catecholamine-induced arrhythmias, digoxin toxicity); prevention of myocardial infarction; migraine headache prophylaxis; symptomatic treatment of hypertrophic subaortic stenosis (hypertrophic obstructive cardiomyopathy)

Use: Unlabeled/InvestigationalTremor due to Parkinson's disease; ethanol withdrawal; aggressive behavior (not recommended for dementia-associated aggression), anxiety, schizophrenia; antipsychotic-induced akathisia; primary and secondary prophylaxis of variceal hemorrhage; acute panic; thyrotoxicosis; tetralogy of Fallot (TOF) hypercyanotic spells

Dosing: Adults

Akathisia (unlabeled use): Oral: 30-120 mg/day in 2-3 divided doses

Essential tremor: Oral: 40 mg twice daily initially; maintenance doses: Usually 120-320 mg/day

Hypertension: Initial: Oral: 40 mg twice daily; increase dosage every 3-7 days; usual dose: 120-240 mg divided in 2-3 doses/day; maximum daily dose: 640 mg; usual dosage range (JNC 7): 40-160 mg/day in 2 divided doses

Extended release formulations:

Inderal® LA: Initial: 80 mg once daily; usual maintenance: 120-160 mg once daily; maximum daily dose: 640 mg; usual dosage range (JNC 7): 60-180 mg/day once daily

InnoPran XL™: Initial: 80 mg once daily at bedtime; if initial response is inadequate, may be increased at 2-3 week intervals to a maximum dose of 120 mg

Hypertrophic subaortic stenosis: Oral: 20-40 mg 3-4 times/day

Inderal® LA: 80-160 mg once daily

Migraine headache prophylaxis: Oral: Initial: 80 mg/day divided every 6-8 hours; increase by 20-40 mg/dose every 3-4 weeks to a maximum of 160-240 mg/day given in divided doses every 6-8 hours; if satisfactory response not achieved within 6 weeks of starting therapy, drug should be withdrawn gradually over several weeks

Inderal® LA: Initial: 80 mg once daily; effective dose range: 160-240 mg once daily

Pheochromocytoma: Oral: 30-60 mg/day in divided doses

Post-MI mortality reduction: Oral: 180-240 mg/day in 3-4 divided doses

Stable angina: Oral: 80-320 mg/day in doses divided 2-4 times/day

Inderal® LA: Initial: 80 mg once daily; maximum dose: 320 mg once daily

Tachyarrhythmias:

Oral: 10-30 mg/dose every 6-8 hours

I.V.: 1-3 mg/dose slow IVP; repeat every 2-5 minutes up to a total of 5 mg; titrate initial dose to desired response

or

0.1 mg/kg divided into 3 equal doses given at 2-3 minute intervals. May repeat total dose in 2 minutes if necessary (ACLS guidelines, 2005)

Note: Once response achieved or maximum dose administered, additional doses should not be given for at least 4 hours.

Thyrotoxicosis (unlabeled use):

Oral: 10-40 mg/dose every 6 hours

I.V.: 1-3 mg/dose slow IVP as a single dose

Variceal hemorrhage prophylaxis (unlabeled use) (Garcia-Tsao, 2007): *Oral:*

Primary prophylaxis: Initial: 20 mg twice daily; adjust to maximal tolerated dose. **Note:** Risk factors for hemorrhage include Child-Pugh class B/C or variceal red wale markings on endoscopy.

Secondary prophylaxis: Initial: 20 mg twice daily; adjust to maximal tolerated dose

Dosing: Elderly

I.V.: Use caution; initiate at lower end of the dosing range.

Oral: Tachyarrhythmias: Initial: 10 mg twice daily; increase dosage every 3-7 days; usual dose range: 10-320 mg/day given in 1-2 divided doses. Refer to adult dosing for additional uses.

Dosing: Pediatric

Hypertension (unlabeled use):

Oral: Initial: 0.5-1 mg/kg/day in divided doses every 6-12 hours; increase gradually every 5-7 days; maximum: 16 mg/kg/24 hours

Migraine headache prophylaxis (unlabeled use): Oral: Initial: 2-4 mg/kg/day **or**

≤35 kg: 10-20 mg 3 times/day

>35 kg: 20-40 mg 3 times/day

Tachyarrhythmias (unlabeled use):

Oral: Initial: 0.5-1 mg/kg/day in divided doses every 6-8 hours; titrate dosage upward every 3-7 days; usual dose: 2-6 mg/kg/day; higher doses may be needed; do not exceed 16 mg/kg/day or 60 mg/day

I.V.: 0.01-0.1 mg/kg/dose slow IVP over 10 minutes; maximum dose: 1 mg for infants; 3 mg for children

Thyrotoxicosis (unlabeled use): Oral:

2 mg/kg/day, divided every 6-8 hours, titrate to effective dose

Adolescents: Refer to adult dosing.

Hypercyanotic spells (TOF) (unlabeled use):

Oral: Palliation: Initial: 1 mg/kg/day every 6 hours; if ineffective, may increase dose after 1 week by 1 mg/kg/day to a maximum of 5 mg/kg/day, if patient becomes refractory, may increase slowly to a maximum of 10-15 mg/kg/day. Allow 24 hours between dosing changes.

I.V.: 0.01-0.2 mg/kg/dose infused over 10 minutes; maximum dose: 5 mg

Dosing: Renal Impairment

Not dialyzable (0% to 5%); supplemental dose is not necessary.

Peritoneal dialysis effects: Supplemental dose is not necessary.

Dosing: Hepatic ImpairmentMarked slowing of heart rate may occur in chronic liver disease with conventional doses; low initial dose and regular heart rate monitoring.

Administration: I.V.I.V. dose is much smaller than oral dose. When administered acutely for cardiac treatment, monitor ECG and blood pressure. May administer by rapid infusion (I.V. push) at a rate of 1 mg/minute or by slow infusion over ~30 minutes. Necessary monitoring for surgical patients who are unable to take oral beta-blockers (prolonged ileus) has not been defined. Some institutions require monitoring of baseline and postinfusion heart rate and blood pressure when a patient's response to beta-blockade has not been characterized (ie, the patient's initial dose or following a change in dose). Consult individual institutional policies and procedures.

Administration: I.V. DetailpH: 2.8-3.5

Administration: OralDo not crush long-acting forms.

Dietary ConsiderationsTablets (immediate release) should be taken on an empty stomach; capsules (extended release) may be taken with or without food, but should always be taken consistently (with food or on an empty stomach)

Storage

Injection: Store at 20°C to 25°C (68°F to 77°F); protect from freezing or excessive heat. Once diluted, propranolol is stable for 24 hours at room temperature in D_5W or NS. Protect from light. Solution has a maximum stability at pH of 3 and decomposes rapidly in alkaline pH.

Capsule, tablet: Store at 20°C to 25°C (68°F to 77°F); protect from freezing or excessive heat. Protect from light and moisture.

CompatibilityStable in $D_5{}^1/_2NS$, D_5NS, D_5W, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Alteplase, gatifloxacin, heparin, hydrocortisone sodium succinate, inamrinone, linezolid, meperidine, milrinone, morphine, potassium chloride, propofol, tacrolimus, vitamin B complex with C. **Incompatible:** Amphotericin B cholesteryl sulfate complex, lansoprazole.

Compatibility in syringe: Compatible: Inamrinone, milrinone. **Incompatible:** HCO_3 .

Compatibility when admixed: Compatible: Dobutamine, verapamil. **Incompatible:** HCO_3 .

ContraindicationsHypersensitivity to propranolol, beta-blockers, or any component of the formulation; uncompensated congestive heart failure (unless the failure is due to tachyarrhythmias being treated with propranolol), cardiogenic shock, severe sinus bradycardia or heart block (2nd or 3rd degree), severe hyperactive airway disease (asthma or COPD)

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure (HF): Use with caution in patients with compensated HF and monitor for a worsening of the condition (efficacy of propranolol in HF has not been demonstrated).
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment required.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.
- Renal impairment: Use with caution in patients with renal impairment; may have increased side effects.
- Thyrotoxicosis: Beta-blockade may mask signs of hyperthyroidism (eg, tachycardia). Abrupt discontinuation of beta-blockade may exacerbate symptoms of hyperthyroidism and may also induce thyroid storm. Alterations in thyroid-function tests may be observed.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function (eg, ether, cyclopropane and trichloroethylene); avoid concurrent I.V. use of both agents.
- Calcium channel blockers (nondihydropyridines): Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered over 1-2 weeks to avoid acute tachycardia, hypertension, and/or ischemia.

Geriatric ConsiderationsSince bioavailability increased in about twofold in elderly patients, geriatrics may require lower maintenance doses. Also, as serum and tissue concentrations increase beta$_1$ selectivity diminishes. Beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults due to alterations in the beta-adrenergic autonomic system. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20%

to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults. Due to propranolol's CNS penetration and nonselective action, it may not be the beta-blocker of choice for use in elderly.

Pregnancy Risk FactorC (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy ConsiderationsEmbryotoxicity has been observed in some animal studies. Propranolol crosses the placenta. Beta-blockers have been associated with bradycardia, hypotension, and IUGR. IUGR is probably related to maternal hypertension. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7). Neonatal hypoglycemia, respiratory depression and congenital abnormalities have been reported following maternal use of beta-blockers.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsPropranolol is excreted in breast milk and breast-feeding is considered compatible by the AAP. It is recommended that the infant be monitored for signs or symptoms of beta-blockade (hypotension, bradycardia, etc) with long-term use.

Adverse ReactionsFrequency not defined.

Cardiovascular: Angina, arterial insufficiency, AV conduction disturbance increased, bradycardia, cardiogenic shock, CHF, hypotension, impaired myocardial contractility, mesenteric arterial thrombosis (rare), Raynaud's syndrome, syncope

Central nervous system: Amnesia, catatonia, cognitive dysfunction, confusion, depression, dizziness, emotional lability, fatigue, hallucinations, hypersomnolence, insomnia, lethargy, lightheadedness, psychosis, vertigo, vivid dreams

Dermatologic: Alopecia, contact dermatitis, cutaneous ulcers, eczematous eruptions, erythema multiforme, exfoliative dermatitis, hyperkeratosis, nail changes, oculomucocutaneous reactions, pruritus, psoriasiform eruptions, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, ulcers, ulcerative lichenoid, urticaria

Endocrine & metabolic: Hyper-/hypoglycemia, hyperkalemia, hyperlipidemia

Gastrointestinal: Anorexia, cramping, constipation, diarrhea, ischemic colitis, nausea, stomach discomfort, vomiting

Genitourinary: Impotence, interstitial nephritis (rare), oliguria (rare), Peyronie's disease, proteinuria (rare)

Hematologic: Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenia, thrombocytopenic purpura

Hepatic: Alkaline phosphatase increased, transaminases increased

Neuromuscular & skeletal: Arthropathy, carpal tunnel syndrome (rare), myotonus, paresthesia, polyarthritis, weakness

Ocular: Hyperemia of the conjunctiva, mydriasis, visual acuity decreased, visual disturbances, xerophthalmia

Renal: BUN increased

Respiratory: Bronchospasm, dyspnea, laryngospasm, pharyngitis, pulmonary edema, respiratory distress, wheezing

Miscellaneous: Anaphylactic/anaphylactoid allergic reaction, cold extremities, lupus-like syndrome (rare)

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), 2C19 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alcohol (Ethyl): May decrease the serum concentration of Propranolol. Alcohol (Ethyl) may increase the serum concentration of Propranolol. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C:*

Monitor therapy

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Fluvoxamine: May increase the serum concentration of Propranolol. Management: Use a lower initial propranolol dose and be cautious with propranolol dose titration. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Serotonin 5-HT1D Receptor Agonists: Propranolol may increase the serum concentration of Serotonin 5-HT1D Receptor Agonists. **Exceptions:** Almotriptan; Eletriptan; Frovatriptan; Naratriptan; SUMAtriptan; Zolmitriptan. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Zileuton: May increase the serum concentration of Propranolol. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Ethanol may increase or decrease plasma levels of propranolol. Reports are variable and have shown both enhanced as well as inhibited hepatic metabolism (of propranolol). Caution advised with consumption of alcohol and monitor for heart rate and/or blood pressure changes.

Food: Propranolol serum levels may be increased if taken with food. Protein-rich foods may increase bioavailability; a change in diet from high carbohydrate/low protein to low carbohydrate/high protein may result in increased oral clearance.

Cigarette: Smoking may decrease plasma levels of propranolol by increasing metabolism.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (american), gotu kola, licorice, yohimbe (may worsen hypertension). Avoid black cohosh, california poppy, coleus, garlic, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (have antihypertensive activity, may cause hypotension).

Monitoring ParametersAcute cardiac treatment: Monitor ECG, heart rate, and blood pressure with I.V. administration; heart rate and blood pressure with oral administration

Reference RangeTherapeutic: 50-100 ng/mL (SI: 190-390 nmol/L) at end of dose interval

Nursing: Physical Assessment/MonitoringAssess potential for adverse interactions with other pharmacological agents or herbal products patient may be taking (eg, cardiac medications, antihypertensives, antimalarials, antipsychotics, or antidiabetic agents). I.V. infusion usually requires hemodynamic monitoring (consult institution protocols). Assess therapeutic effect (according to purpose for use) and adverse reactions when starting or adjusting dosage and on a regular basis. When discontinuing, drug must be tapered gradually over 2 weeks to avoid acute tachycardia, hypertension, and/or ischemia. Caution patients with diabetes to monitor blood glucose levels closely; beta-blockers can mask hypoglycemic symptoms. Teach patient proper use (when self-administered), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber. If administered by infusion; report immediately any pain, redness, or swelling at infusion site; any palpitations or chest pain, dizziness, difficulty breathing, or other adverse reactions. **Oral:** Take exactly as directed; do not increase, decrease, or discontinue without consulting prescriber. If you have diabetes, monitor blood sugars carefully; beta-blockers may mask hypoglycemic symptoms. Tablets may be crushed and taken with liquids. Do not crush or chew long-acting forms; swallow whole. You may experience orthostatic hypotension, dizziness, drowsiness, or blurred vision. Use caution when driving, climbing stairs, changing position (rising from sitting or lying to standing), or engaging in tasks requiring alertness until response to drug is know. May cause nausea vomiting, or stomach discomfort (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain or palpitations; persistent dizziness or lethargy; any CNS symptoms (amnesia, change in cognition, confusion, depression, hallucinations, insomnia, vivid dreams; rash; difficulty breathing or wheezing; weakness, pain, or loss of sensation in extremities or other adverse symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, extended release, as hydrochloride: 60 mg, 80 mg, 120 mg, 160 mg

InnoPran XL™: 80 mg, 120 mg

Capsule, sustained release, as hydrochloride:

Inderal® LA: 60 mg, 80 mg, 120 mg, 160 mg

Injection, solution, as hydrochloride: 1 mg/mL (1 mL)

Inderal®: 1 mg/mL (1 mL) [DSC]

Solution, oral, as hydrochloride: 4 mg/mL (500 mL); 8 mg/mL (500 mL) [strawberry-mint flavor; contains alcohol 0.6%]

Tablet, as hydrochloride: 10 mg, 20 mg, 40 mg, 60 mg, 80 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Inderal LA)

80 mg (30): $132.48

120 mg (30): $157.40

160 mg (30): $194.99

Capsule, 24-hour (InnoPran XL)

80 mg (30): $68.33

120 mg (30): $70.34

Capsule, 24-hour (Propranolol HCl CR)

60 mg (100): $99.99

80 mg (100): $115.99

120 mg (100): $139.98

160 mg (100): $182.98

Solution (Propranolol HCl)

20 mg/5 mL (240): $25.99

Tablets (Propranolol HCl)

10 mg (100): $12.99

20 mg (100): $13.99

40 mg (30): $12.99

60 mg (60): $55.99

80 mg (90): $14.03

Mechanism of ActionNonselective beta-adrenergic blocker (class II antiarrhythmic); competitively blocks response to beta$_1$- and beta$_2$-adrenergic stimulation which results in decreases in heart rate, myocardial contractility, blood pressure, and myocardial oxygen demand. Nonselective beta-adrenergic blockers (propranolol, nadolol) reduce portal pressure by producing splanchnic vasoconstriction (beta$_2$ effect) thereby reducing portal blood flow.

Pharmacodynamics/Kinetics

Onset of action: Beta-blockade: Oral: 1-2 hours

Duration: Immediate release: 6-12 hours; Extended-release formulations: ~24-27 hours

Distribution: V$_d$: 4 L/kg in adults; crosses placenta; small amounts enter breast milk

Protein binding: Newborns: 68%; Adults: 90%

Metabolism: Hepatic to active and inactive compounds; extensive first-pass effect

Bioavailability: 30% to 40%

Half-life elimination: Neonates and Infants: Possible increased half-life; Children: 3.9-6.4 hours; Adults: Immediate release formulation: 3-6 hours; Extended-release formulations: 8-10 hours

Time to peak: Immediate release: 1-4 hours; Extended-release formulations: ~6-14 hours

Excretion: Urine (96% to 99%)

Dental Health: Effects on Dental TreatmentPropranolol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine has interacted with nonselective beta-blockers to result in initial hypertensive episode followed by bradycardia

Mental Health: Effects on Mental StatusFatigue and malaise are common and often mistaken for depression; may also cause dizziness, confusion, insomnia, or hallucinations

Mental Health: Effects on Psychiatric TreatmentLow-dose propranolol is considered by many to be the drug of choice for akathisia. Concurrent use with psychotropic drugs may produce additive hypotensive effects; monitor blood pressure. Cutaneous reactions, including Stevens-Johnson syndrome, have been reported with use of propranolol; use caution with lamotrigine or valproic combination as combined usage with propranolol has been associated with these reactions.

Cardiovascular Considerations

Atrial Fibrillation: Beta-blocker therapy provides effective rate control in patients with atrial fibrillation.

Chronic Stable Angina: Beta-blockers are effective in the treatment of angina as monotherapy or when combined with nitrates and/or calcium channel blockers. In patients with severe intractable angina requiring negative cardiac chronotropic medications, pacemaker placement has been carried out to maintain heart rate in the setting of large doses of beta-blockers and/or calcium channel blockers. Beta-blockers are ineffective in the treatment of pure vasospastic (Prinzmetal) angina.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists that requires the use of other drugs, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, postmyocardial infarction, high coronary disease risk, or diabetes. In type 2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

ST-Segment Elevation Myocardial Infarction (STEMI): Beta-blockers, without intrinsic sympathomimetic activity (ISA), have been shown to decrease morbidity and mortality when initiated in the acute treatment of STEMI and continued long-term. Oral beta-blockade should be initiated promptly in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade may be considered and given promptly if the patient is experiencing concomitant hypertension or a tachyarrhythmia (Class IIa recommendation).

Unstable Angina/Non-ST-Segment Elevation MI (UA/NSTEMI): In the treatment of UA/NSTEMI, oral beta-blockade should be initiated within the first 24 hours in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade should only be considered if the patient is experiencing concomitant hypertension upon presentation (Class IIa recommendation).

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, or other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation).

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery especially in high-risk patients; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Juul, 2006; Yang, 2006).

Propylhexedrine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(proe pil HEKS e dreen)
U.S. Brand NamesBenzedrex® [OTC]
Pharmacologic CategoryAdrenergic Agonist Agent
Use: Labeled IndicationsTopical nasal decongestant
Dosing: Adults**Decongestant:** Nasal: Two inhalations in each nostril, not more frequently than every 2 hours
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren 6-12 years: Refer to adult dosing.
Administration: InhalationFor nasal inhalation only.
StorageStore at 15°C to 30°C (59°F to 86°F). Keep tightly closed. Product effective for at least 3 months after opening.
ContraindicationsHypersensitivity to propylhexedrine or any component of the formulation
Warnings/Precautions

Special populations:

- Pediatrics: Not for OTC use in children <6 years of age.

Dosage form specific issues:

- Nasal: For nasal use only. Do not exceed recommended dosage; do not use for more than 3 days.

Adverse ReactionsFrequency not defined.

Local: Nasal: Burning, stinging

Respiratory: Sneezing, nasal discharge increased

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Inhaler, nasal: 0.4-0.5 mg/inhalation (1s) [total content 250 mg]

Generic AvailableNo
ManufacturerBF Ascher
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Propylthiouracil

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Propylthiouracil may be confused with Purinethol®

PTU is an error-prone abbreviation (mistaken as mercaptopurine [Purinethol®; 6-MP])

Pronunciation(proe pil thye oh YOOR a sil)

Canadian Brand NamesPropyl-Thyracil®

Pharmacologic CategoryAntithyroid Agent; Thioamide

Use: Labeled IndicationsPalliative treatment of hyperthyroidism as an adjunct to ameliorate hyperthyroidism in preparation for surgical treatment or radioactive iodine therapy; management of thyrotoxic crisis

Dosing: Adults

Hyperthyroidism: Oral: 300-400 mg/day in divided doses every 6-8 hours. In patients with severe hyperthyroidism, very large goiters, or both, the initial dosage is usually 400 mg/day; an occasional patient will require 600-900 mg/day; maintenance: 100-150 mg/day in divided doses every 8-12 hours

Note: Administer in 3 equally divided doses at approximately 8-hour intervals. Adjust dosage to maintain T_3, T_4, and TSH levels in normal range; elevated T_3 may be sole indicator of inadequate treatment. Elevated TSH indicates excessive antithyroid treatment.

Thyrotoxic crisis: Recommendations vary widely and have not been evaluated in comparative trials: Dosages of 200-300 mg every 4-6 hours have been recommended for short-term initial therapy (until initial response), followed by gradual reduction to a maintenance dosage (100-150 mg/day in divided doses).

Dosing: ElderlyUse lower dose recommendations; adjust for renal impairment.

Initial: 150-300 mg/day in divided doses every 8 hours

Maintenance: 100-150 mg/day in divided doses every 8-12 hours

Dosing: Pediatric

Hyperthyroidism: Oral: Children: Initial: 5-7 mg/kg/day **or** 150-200 mg/m^2/day in divided doses every 8 hours **or**

6-10 years: 50-150 mg/day

>10 years: 150-300 mg/day

Maintenance: Determined by patient response **or** $^1/_3$ to $^2/_3$ of the initial dose in divided doses every 8-12 hours. This usually begins after 2 months on an effective initial dose.

Note: Administer in 3 equally divided doses at approximately 8-hour intervals. Adjust dosage to maintain T_3, T_4, and TSH levels in normal range; elevated T_3 may be sole indicator of inadequate treatment. Elevated TSH indicates excessive antithyroid treatment.

Dosing: Renal ImpairmentAdjustment is not necessary.

Calculations

- Body Surface Area: Pediatrics

Dietary ConsiderationsAdminister at the same time in relation to meals each day, either always with meals or always between meals.

Extemporaneously PreparedA 5 mg/mL oral suspension was stable for 10 days when refrigerated when compounded as follows:

Triturate six 50 mg tablets in a mortar, reduce to a fine powder, add 30 mL of carboxymethylcellulose 1.5%, transfer to a graduate and qs to 60 mL

Shake well before using and keep in refrigerator; protect from light

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 3rd ed, Cincinnati, OH: Harvey Whitney Books Co, 1997.

ContraindicationsHypersensitivity to propylthiouracil or any component of the formulation; breast-feeding (per manufacturer; however, expert analysis and the AAP state this drug may be used in nursing mothers)

Allergy Considerations

- Thioureylene Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: May cause hypoprothrombinemia and bleeding; use with particular caution in patients >40 years of age.
- Bone marrow suppression: May cause significant bone marrow depression; the most severe manifestation is agranulocytosis. Aplastic anemia, thrombocytopenia, and leukopenia may also occur. Use with caution in patients receiving other drugs known to cause myelosuppression particularly agranulocytosis; discontinue if significant bone marrow suppression occurs, particularly agranulocytosis or aplastic anemia.
- Carcinoma/hyperplasia: Thyroid hyperplasia or carcinoma may occur with prolonged usage (>1 year).
- Dermatitis: Has been associated with rare but severe dermatologic reactions; discontinue in the presence of exfoliative dermatitis.
- Fever: Discontinue in the presence of unexplained fever.
- Hepatic reactions: Rare, severe hepatic reactions (hepatic necrosis, hepatitis) may occur. Symptoms suggestive of hepatic dysfunction should prompt evaluation; discontinue in the presence of hepatitis (transaminase > 3x upper limit of normal).
- Lupus-like syndrome: Has been associated with a variety of autoimmune reactions, including a lupus-like syndrome; discontinuation may be warranted.
- Nephritis: Has been associated with glomerulonephritis and interstitial nephritis with acute renal failure; discontinuation of therapy may be warranted.
- Pneumonitis: Has been associated with rare reports of interstitial pneumonitis. Prompt evaluation is warranted in patients reporting respiratory signs/symptoms consistent with this reaction; discontinuation is warranted in cases or interstitial pneumonitis.
- Vasculitis: Has been associated (rarely) with the development of ANCA-positive vasculitis or leukocytoclastic vasculitis; prompt discontinuation is warranted in patients who develop vasculitis during therapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Geriatric ConsiderationsThe use of antithyroid thioamides is as effective in the elderly as they are in younger adults.

Pregnancy Risk FactorD

Pregnancy ConsiderationsPropylthiouracil crosses the placenta and because adverse events may occur in the fetus following maternal use, it is classified as pregnancy category D. The rate of congenital defects does not appear to be increased with maternal propylthiouracil use; however, fetal thyroid function may be transiently suppressed. Untreated hyperthyroidism may also cause adverse events in the mother (eg, heart failure, miscarriage, preeclampsia, thyroid storm), fetus (eg, goiter, growth restriction, hypo/hyperthyroidism, still birth) and neonate (eg, hyper-/hypothyroidism, neuropsychologic damage). The thioamides are treatment of choice for hyperthyroidism during pregnancy. In order to prevent adverse events to the fetus, the lowest effective dose should be used in order to achieve maternal levels of T_4 in the high euthyroid or low hyperthyroid range. Thyroid function should be monitored closely.

LactationEnters breast milk/contraindicated (per manufacturer) (AAP rates “compatible”)

Breast-Feeding ConsiderationsPropylthiouracil is found in breast milk at levels <0.3% of the weight adjusted maternal dose. Although breastfeeding is contraindicated by the manufacturer, the AAP and other expert analysis have concluded that breast-feeding is generally considered safe. Reviews of thionamide use while breast-feeding have not shown that thyroid function of the breast-fed infant is significantly affected.

Adverse ReactionsFrequency not defined.

Cardiovascular: ANCA-positive vasculitis, cutaneous vasculitis, edema, leukocytoclastic vasculitis

Central nervous system: Dizziness, drowsiness, drug fever, fever, headache, neuritis, vertigo

Dermatologic: Alopecia, erythema nodosum, exfoliative dermatitis, pruritus, skin rash, urticaria

Endocrine & metabolic: Goiter, swollen salivary glands, weight gain

Gastrointestinal: Constipation, loss of taste perception, nausea, stomach pain, vomiting

Hematologic: Agranulocytosis, aplastic anemia, bleeding, leukopenia, thrombocytopenia

Hepatic: Cholestatic jaundice, hepatitis

Neuromuscular & skeletal: Arthralgia, paresthesia

Renal: Acute renal failure, glomerulonephritis, nephritis

Respiratory: Alveolar hemorrhage, interstitial pneumonitis

Miscellaneous: SLE-like syndrome

Drug Interactions

Sodium Iodide I131: Antithyroid Agents may diminish the therapeutic effect of Sodium Iodide I131. Management: Discontinue antithyroid therapy 3-4 days prior to sodium iodide I-131 administration. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antithyroid Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Propylthiouracil serum levels may be altered if taken with food.
Monitoring ParametersCBC with differential, prothrombin time, liver function tests, thyroid function tests (TSH, T_3, T_4); periodic blood counts are recommended chronic therapy
Reference RangeNormal laboratory values:

Total T_4: 5-12 mcg/dL

Serum T_3: 90-185 ng/dL

Free thyroxine index (FT_4 I): 6-10.5

TSH: 0.5-4.0 microunits/mL

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, anticoagulant activity increased). Assess results of laboratory tests, therapeutic effectiveness according to use, and adverse response (eg, rash, goiter, nausea, vomiting, leukopenia, agranulocytosis, anemia, jaundice, arthralgia, CNS stimulation or depression). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential, prothrombin time, liver and thyroid function (T_4, T_3, TSH); periodic blood counts are recommended for chronic therapy.
Patient EducationTake as directed, at the same time each day at around-the-clock intervals; at the same time in relation to meals, either always with meals or always between meals. Do not miss doses or make up missed doses. This drug may need to be taken for an extended period of time to achieve appropriate results and you may need periodic blood tests to assess effectiveness of therapy. May cause nausea or vomiting (small, frequent meals may help); constipation (increased exercise, fluids, fruit, or fiber may help); or dizziness or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report rash, skin eruptions, or loss of hair; fever; unusual bleeding or bruising; unusual weight gain (>5 lb/week); unresolved headache or fever; yellowing of eyes or skin; changes in color of urine or feces; or joint or muscle pain or weakness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 50 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Propylthiouracil)

50 mg (90): $17.99

Mechanism of ActionInhibits the synthesis of thyroid hormones by blocking the oxidation of iodine in the thyroid gland; blocks synthesis of thyroxine and triiodothyronine
Pharmacodynamics/Kinetics

Onset of action: Therapeutic: 24-36 hours

Peak effect: Remission: 4 months of continued therapy

Duration: 2-3 hours

Distribution: Concentrated in the thyroid gland

Protein binding: 75% to 80%

Metabolism: Hepatic

Bioavailability: 80% to 95%

Half-life elimination: 1.5-5 hours; End-stage renal disease: 8.5 hours

Time to peak, serum: ~1 hour

Excretion: Urine (35%)

Pharmacotherapy PearlsPreferred over methimazole in thyroid storm due to inhibition of peripheral conversion as well as synthesis of thyroid hormone.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Loss of taste perception.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness
Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; avoid clozapine and carbamazepine
Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Agranulocytosis, when it occurs, is usually seen during the first several months of therapy.

The use of antithyroid thioamides is as effective in elderly as in younger adults; however, the expense, potential adverse effects, and inconvenience (compliance, monitoring) make them undesirable. The use of radioiodine, due to ease of administration and less concern for long-term side effects and reproduction problems, makes it a more appropriate therapy.

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Protamine may be confused with ProAmatine®, Protonix®, Protopam®, Protropin®

Pronunciation(PROE ta meen SUL fate)

Pharmacologic Category[Antidote]

Use: Labeled IndicationsTreatment of heparin overdosage; neutralize heparin during surgery or dialysis procedures

Use: Unlabeled/InvestigationalTreatment of low molecular weight heparin (LMWH) overdose

Dosing: Adults

Heparin neutralization: I.V.: Protamine dosage is determined by the dosage of heparin; 1 mg of protamine neutralizes 90 USP units of heparin (lung) and 115 USP units of heparin (intestinal); maximum dose: 50 mg

Heparin overdosage, following intravenous administration: I.V.: Since blood heparin concentrations decrease rapidly **after** administration, adjust the protamine dosage depending upon the duration of time since heparin administration as follows: See table.

Time Elapsed	Dose of Protamine (mg) to Neutralize 100 units of Heparin
Immediate	1-1.5
30-60 min	0.5-0.75
>2 h	0.25-0.375

Heparin overdosage, following SubQ injection: I.V.: 1-1.5 mg protamine per 100 units heparin; this may be done by a portion of the dose (eg, 25-50 mg) given slowly I.V. followed by the remaining portion as a continuous infusion over 8-16 hours (the expected absorption time of the SubQ heparin dose)

LMWH overdose (unlabeled use):

Enoxaparin: 1 mg protamine for each mg of enoxaparin; if PTT prolonged 2-4 hours after first dose, consider additional dose of 0.5 mg for each mg of enoxaparin.

Dalteparin or tinzaparin: 1 mg protamine for each 100 anti-Xa int. units of dalteparin or tinzaparin; if PTT prolonged 2-4 hours after first dose, consider additional dose of 0.5 mg for each 100 anti-Xa int. units of dalteparin or tinzaparin.

Note: Antifactor Xa activity never completely neutralized (maximum: ~60% to 75%). Excessive protamine doses may worsen bleeding potential.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: I.V.For I.V. use only. Administer slow IVP (50 mg over 10 minutes). Rapid I.V. infusion causes hypotension. Reconstitute vial with 5 mL sterile water. Resulting solution equals 10 mg/mL. Inject without further dilution over 1-3 minutes; maximum of 50 mg in any 10-minute period.

Administration: I.V. DetailpH: 6-7

StorageRefrigerate; do not freeze. Stable for at least 2 weeks at room temperature. Preservative-free formulation does not require refrigeration.

ReconstitutionReconstitute vial with 5 mL sterile water. If using protamine in neonates, reconstitute with preservative-free sterile water for injection; resulting solution equals 10 mg/mL.

CompatibilityStable in D_5W, NS.

Compatibility in syringe: Compatible: Iohexol 64.7%, iopamidol 61%, iothalamate meglumine 60%. **Incompatible:** Diatrizoate meglumine 52%, diatrizoate sodium 8%, diatrizoate sodium 60%, ioxaglate meglumine 39.3%, ioxaglate sodium 19.6%.

Compatibility when admixed: Compatible: Cimetidine, ranitidine, verapamil. **Incompatible:** Cephalosporins, penicillins.

ContraindicationsHypersensitivity to protamine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Heparin rebound: Heparin rebound associated with anticoagulation and bleeding has been reported to occur occasionally; symptoms typically occur 8-9 hours after protamine administration, but may occur as long as 18 hours later.

- Hypersensitivity reactions: May cause hypersensitivity reaction in patients with a history of allergy to fish (have epinephrine 1:1000 available) and in patients sensitized to protamine (via protamine-containing insulins).

- Infusion reactions: Too rapid administration can cause severe hypotensive and anaphylactoid-like reactions.

Special populations:

- Cardiac surgery patients: May be ineffective in some patients following cardiac surgery despite adequate doses.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Cardiovascular: Sudden fall in blood pressure, bradycardia, flushing, hypotension

Central nervous system: Lassitude

Gastrointestinal: Nausea, vomiting

Hematologic: Hemorrhage

Respiratory: Dyspnea, pulmonary hypertension

Miscellaneous: Hypersensitivity reactions

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersCoagulation test, aPTT or ACT, cardiac monitor and blood pressure monitor required during administration
Nursing: Physical Assessment/MonitoringAssess results of laboratory tests and therapeutic effectiveness frequently during therapy. Monitor closely for adverse response. Assess knowledge/teach patient possible side effects and adverse symptoms to report.
Monitoring: Lab TestsCoagulation test, aPTT or ACT
Patient EducationReport any respiratory difficulty, rash or flushing, feeling of warmth, tingling or numbness, dizziness, or disorientation.
Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sulfate [preservative free]: 10 mg/mL (5 mL, 25 mL)

Generic AvailableYes
Mechanism of ActionCombines with strongly acidic heparin to form a stable complex (salt) neutralizing the anticoagulant activity of both drugs
Pharmacodynamics/KineticsOnset of action: I.V.: Heparin neutralization: ~5 minutes
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsProtamine is used after coronary artery bypass graft. It is important that very careful monitoring of heart rate and blood pressure be conducted during protamine therapy because of possible acute hypotension. Occasionally, patients may develop heparin rebound with anticoagulation and bleeding, between 8-18 hours after protamine administration. Anaphylaxis or hypersensitivity responses with acute hypotension to protamine may present with its use, especially in patients with allergies to fish, previous exposure to protamine through previous use of protamine or protamine-containing insulin, infertile men, and vasectomized males.

Protamine's reversal of LMWHs is not as complete or predictable as with heparin. Protamine will not reverse the effects of thrombin inhibitors. Excessive protamine dosing (>100 mg) may worsen bleeding by acting as an anticoagulant.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Monitor vital signs closely during protamine therapy because of possible hypotension during administration.

Anaphylaxis or hypersensitivity responses with acute hypotension to protamine may present with its use, especially in patients with allergies to fish, previous exposure to protamine (through previous use of protamine or protamine-containing insulin), infertile or vasectomized males.

Evidence-Based Information:

Management of Intracerebral Hemorrhage (ICH) Due to Unfractionated Heparin (UFH): Overall management of ICH is similar regardless of cause; however, iatrogenic spontaneous ICH may have specific treatments. According to the 2007 ACC/ASA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage, UFH-related ICH should be treated with I.V. protamine given by slow I.V. injection (not to exceed 5 mg/minute) with a maximum dose of 50 mg (Class I recommendation). Faster infusions of protamine can result in cardiovascular collapse.

Protamine's reversal of LMWHs is not as complete or predictable as with heparin. Protamine neutralizes the antithrombin activity of LMWHs, but the cationic protein neutralizes the antifactor Xa activity incompletely. A recent case illustrates a failure to reverse enoxaparin (Makris, 2000). Protamine will not reverse the effects of thrombin inhibitors such as lepirudin, bivalirudin, or argatroban.

Protein C Concentrate (Human)

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ceprotin may be confused with aprotinin, Cipro®

Protein C concentrate (human) may be confused with activated protein C (human, recombinant) which refers to drotrecogin alfa

Pronunciation(PROE teen cee KON suhn trate HYU man)

U.S. Brand NamesCeprotin

Pharmacologic CategoryAnticoagulant; Blood Product Derivative; Enzyme; Protein C

Use: Labeled IndicationsReplacement therapy for severe congenital protein C deficiency for the prevention and/or treatment of venous thromboembolism and purpura fulminans

Dosing: AdultsPatient variables (including age, clinical condition, and plasma levels of protein C) will influence dosing and duration of therapy. Individualize dosing based on protein C activity and patient pharmacokinetic profile. Dosing is dependent on the severity of protein C deficiency, age of patient, clinical condition, and patient's level of protein C. The frequency, duration, and dose should be individualized.

Severe congenital protein C deficiency: I.V.:

Acute episode/short-term prophylaxis: Initial dose: 100-120 int. units/kg (for determination of recovery and half-life)

Subsequent 3 doses: 60-80 int. units/kg every 6 hours (adjust to maintain peak protein C activity of 100%)

Maintenance dose: 45-60 int. units/kg every 6 or 12 hours (adjust to maintain recommended maintenance trough protein C activity levels >25%)

Long-term prophylaxis: Maintenance dose: 45-60 int. units/kg every 12 hours (recommended maintenance trough protein C activity levels >25%)

Note: Maintain target peak protein C activity of 100% during acute episodes and short-term prophylaxis. Maintain trough levels of protein C activity >25%. Higher peak levels of protein C may be necessary in prophylactic therapy of patients at increased risk for thrombosis (eg, infection, trauma, surgical intervention).

Dosing: PediatricPatient variables (including age, clinical condition, and plasma levels of protein C) will influence dosing and duration of therapy. Individualize dosing based on protein C activity and patient pharmacokinetic profile. Dosing is dependent on the severity of protein C deficiency, age of patient, clinical condition, and patient's level of protein C. The frequency, duration, and dose should be individualized.

Severe congenital protein C deficiency: I.V. Refer to adult dosing.

Note: Maintain target peak protein C activity of 100% during acute episodes and short-term prophylaxis. Maintain trough levels of protein C activity >25%. Higher peak levels of protein C may be necessary in prophylactic therapy of patients at increased risk for thrombosis (eg, infection, trauma, surgical intervention).

Administration: I.V.Administer by intravenous injection at a rate not to exceed 2 mL/minute. In children <10 kg, administration should not exceed a rate of 0.2 mL/kg/minute. Administration must be completed within 3 hours of solution preparation.

Dietary ConsiderationsAt maximum daily doses, product formulation contains sodium >200 mg.

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light.

ReconstitutionAllow Ceprotin and sterile water vial to warm to room temperature. Reconstitute 500 int. units vial with 5 mL and 1000 int. units vial with 10 mL sterile water for injection (resultant concentration ~100 int. units/mL). Gently swirl vial after adding the diluent until powder is completely dissolved. Use provided filter needle to withdraw solution from vial; remove filter needle prior to administration. The resulting solution (which is preservative free) should be administered within 3 hours and any unused portion should be discarded.

ContraindicationsHypersensitivity to protein C or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Heparin-induced thrombocytopenia (HIT): Trace amounts of heparin contained within the formulation may lead to HIT; evaluate platelet counts if HIT is suspected.
- Hypersensitivity reactions: Formulation may contain trace amounts of mouse protein and/or heparin. Discontinue use in the presence of hypersensitivity/allergic reactions.

Disease-related concerns:

- Hepatic impairment: Use caution; not studied in hepatic impairment.
- Renal impairment: Use caution; not studied in patients with renal impairment.

Concurrent drug therapy issues:

- Anticoagulants: An increase risk of bleeding may be seen in patients receiving concomitant anticoagulant therapy including thrombolytic agents, heparin, oral anticoagulants, glycoprotein IIb/IIIa antagonists, platelet aggregation inhibitors, and aspirin.

Special populations:

- Sodium-restricted patients: Use with caution in patients where sodium restriction is necessary.

Other warnings/precautions:

- Infections: Product of human plasma; may potentially contain infectious agents which could transmit disease; screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces this risk. (Consideration should be given for patients to receive appropriate vaccinations during therapy [eg, hepatitis A or B vaccine].)

Geriatric ConsiderationsAccording to the manufacturer, an insufficient number of subjects ≥65 years of age were enrolled in the clinical trials to determine whether elderly patients respond differently than younger ones.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproductive studies have not been performed. It is unknown if administration during pregnancy will result in fetal harm.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsUse in nursing mothers has not been studied.

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding may be associated with protein C administration. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the concurrent use of multiple agents that alter hemostasis and patient susceptibility. Frequency not defined.

Central nervous system: Lightheadedness

Hematologic: Bleeding

Miscellaneous: Hypersensitivity reactions (itching and rash)

Postmarketing and/or case reports: Fever, hemothorax, hypotension, hyperhidrosis, restlessness

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Recent use/intake of herbs with anticoagulant or antiplatelet activity (including cat's claw, feverfew, garlic, ginkgo, ginseng, and horse chestnut seed) may increase the risk of bleeding.

Monitoring ParametersProtein C activity (chromogenic assay) prior to and during therapy; signs and symptoms of bleeding; hemoglobin/hematocrit, PT/INR, platelet count

Reference RangeMaintain target peak protein C activity of 100% during acute episodes and short-term prophylaxis. Maintain trough levels of protein C activity >25%. Higher peak levels of protein C may be necessary in prophylactic therapy of patients at increased risk for thrombosis (eg, infection, trauma, surgical intervention).

Nursing: Physical Assessment/MonitoringEvaluate any history of hypersensitivity to mouse protein or heparin prior to beginning therapy. Discuss risk/benefit ratio concerning transmission of infectious agents with patient prior to therapy and evaluate need for appropriate vaccinations. Assess other pharmacological or herbal products patient may be taking for potential adverse interactions, specifically any agents that may potentially increase risk of bleeding. See specific administration directions. Treatment for anaphylactic reaction should be immediately available during use. Assess results of laboratory reports prior to and on a regular basis during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsProtein C activity (chromogenic assay) prior to and during therapy; hemoglobin/hematocrit, PT/INR, platelet count

Patient EducationThis medication can only be administered by intravenous infusion. You will be monitored during and following infusions;

report immediately any difficulty breathing, rash or itching, or difficulty swallowing. If self-administered, follow exact instructions as directed. You may experience lightheadedness (use caution when driving or engaging in tasks that require alertness until response to medication is known). Report immediately any unusual bleeding or bruising, restlessness, difficulty breathing, persistent dizziness, or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage Forms

Injection, powder for reconstitution:

Ceprotin: ~500 int. units [actual potency printed on vial label; contains human albumin and sodium; may contain trace amounts of mouse protein or heparin; packaged with diluent]; ~1000 int. units [actual potency printed on vial label; contains human albumin and sodium; may contain trace amounts of mouse protein or heparin; packaged with diluent]

Generic AvailableNo

ManufacturerBaxter Healthcare Corp

Mechanism of ActionConverted to activated protein C (APC). APC is a serine protease which inactivates factors Va and VIIIa, limiting thrombotic formation. *In vitro* data also suggest inhibition of plasminogen activator inhibitor-1 (PAF-1) resulting in profibrinolytic activity, inhibition of macrophage production of tumor necrosis factor, blocking of leukocyte adhesion, and limitation of thrombin-induced inflammatory responses.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.074L/kg

Metabolism: Activated protein C (APC) inactivated by plasma protease inhibitors

Half-life elimination: Median: 9.8 hours; range 4.9-14.7 hours

Time to peak, plasma: T_{max}: 0.5 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsProtein C

International Brand NamesCeprotin (AT, BE, BG, CH, CZ, DE, DK, ES, FI, FR, GB, GR, HN, IE, IT, NL, NO, PT, RU, SE, TR); Protexel (FR)

Prothrombin Complex (Human) [(Factors II, VII, IX, X), Protein C, and Protein S]

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(PRO throm bin KOM pleks HYU man FAK ters too SEV en nyne ten PROE teen cee & PROE teen ess)

Canadian Brand NamesOctaplex®

Pharmacologic Category[Hemostatic Agent](); [Prothrombin Complex Concentrate (PCC)]()

Use: Labeled IndicationsProphylaxis (perioperative) and treatment of bleeding due to acquired deficiency (eg, overdose of vitamin K antagonist) of one or more of the prothrombin complex coagulation factors II, VII, IX, and X, when rapid correction of factor deficiency is necessary

Dosing: Adults

Dosing should be individualized based on severity of disorder, extent and location of bleeding, and clinical status of patient.

Bleeding/perioperative prophylaxis of bleeding during vitamin K antagonist therapy: I.V.: **Note:** Maximum dose not to exceed 120 mL: Approximate doses required for normalization of INR (≤1.2 within 1 hour):

Initial INR: 2-2.5: Administer 0.9-1.3 mL/kg

2.5-3: Administer 1.3-1.6 mL/kg

3-3.5: Administer 1.6-1.9 mL/kg

>3.5: Administer >1.9 mL/kg

With the correction of vitamin K antagonist-induced impairment of hemostasis in patients who have been treated concomitantly with an appropriate vitamin K dose, repeat dosing with PCC is usually not necessary.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥17 years: Refer to adult dosing.

Administration: I.V.Measure pulse rate before and during infusion. Administer at a rate of 1 mL/minute initially, followed by 2-3 mL/minute. Reduce infusion rate or interrupt infusion if patient's pulse rate increases significantly.

StorageStore 2°C to 8°C (35°F to 46°F); do not freeze. Protect from light.

ReconstitutionAllow diluent (SWFI) and prothrombin complex concentrate vial to warm to room temperature (if using a water bath temperature should not exceed 37°C ([98.6°F]). Aseptically remove protective cover from short end of double-ended needle and insert into diluent vial (needle should be visible in vial). Aseptically remove protective cover from long end of double-ended needle and insert into upright concentrate vials; water is drawn by vacuum into concentrate vial. Remove double-ended needle with empty diluent vial. Gently rotate concentrate vial until contents are completely dissolved. Resulting solution should be colorless to slightly blue. Reconstituted solution should be used immediately. Do not use concentrate if dissolution is incomplete or aggregate forms. Discard any unused portion.

CompatibilityDo not introduce other medications into the same I.V. line.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to any component of the formulation; heparin-induced thrombocytopenia type II or known allergy to heparin; non-life-threatening bleeds in individuals with recent myocardial infarction, high risk of thrombosis, or angina pectoris; untreated disseminated intravascular coagulation (DIC); bleeding associated with hepatic parenchyme disorders, esophageal varices, or major hepatic surgery

Warnings/Precautions

Concerns related to adverse effects:

- Antibody formation: Development of antibodies to one or more of the human prothrombin factors may occur rarely resulting in an inadequate clinical response; monitor for signs of antibody formation.
- Hematologic events: Use has been associated with thrombosis and may be associated with an increased risk of DIC and thromboembolic complications including MI, in patients with acquired or congenital factor deficiency, particularly with repeated dosing or in treatment of isolated factor VII deficiency; use with caution in patients with a history of any condition (eg, MI, coronary artery disease CAD) that increases the risk for thromboembolic events or DIC; monitor closely for signs/symptoms of thrombosis or intravascular coagulation; use with caution in hepatic dysfunction, peri/postoperative patients and neonates; use in DIC and hyperfibrinolysis only after appropriate therapy (eg, heparin, antithrombin, antifibrinolytics) for disruption of the consumptive coagulation process has been administered.
- Hypersensitivity reactions: Prophylactic treatment with antihistamines and/or glucocorticoids may be necessary in patients predisposed to allergies. Glucocorticoids and/or antihistamines also may be used to control mild allergic reactions. Severe hypersensitivity and anaphylactic reactions may rarely occur with use; immediate medical treatment (including epinephrine 1:1000) should be readily available in the event of a severe reaction.

Disease-related concerns:

- Chronic liver disease or transplantation: Monitor antithrombin (AT) levels in patients being treated for bleeding as a result of chronic liver disease or liver transplantation. If AT levels are deficient, AT should be administered concomitantly with PCC. No clinical data is available for use of PCC to treat bleeding due to liver parenchyme disorders, major liver surgery, or esophageal varices; use of PCC for these indications is contraindicated and the preferred method of treatment is fresh frozen plasma (FFP).

- Hypercoagulopathy: Administration of PCC may exacerbate underlying hypercoagulable states in recipients of vitamin K antagonists.

Special populations:

- Pediatrics: Safety and efficacy have not been established in patients <17 years of age.

Dosage form specific issues:

- Heparin: Formulation contains heparin.

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer. Hepatitis B vaccination is recommended for all patients. Hepatitis A vaccination is also recommended for seronegative patients.

Other warnings/precautions:

- Coagulation factor deficiency: Hepatic synthesis of the prothrombin complex (Factors II, VII, IX and X) coagulation factors is vitamin K dependent. Severe hepatic dysfunction, inadequate absorption of vitamin K (eg, pancreatic disorders, diarrhea) or vitamin K antagonist therapy or overdose may lead to coagulation factor deficiencies. In patients with an acquired deficiency of the vitamin K dependent coagulation factors, administer prothrombin complex concentrate (PCC) only if a rapid correction (eg, emergency surgery, major bleeding) is necessary. If not indicated and caused by Vitamin K antagonist therapy, coagulation factor deficiencies may be managed by reducing or discontinuing therapy of the vitamin K antagonist and/or administration of vitamin K.

Pregnancy ConsiderationsModerate-to-significant decreases in fetal body weight have been observed in some animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed. Parvovirus B19 or hepatitis A, which may be present in plasma-derived products, may affect a pregnant woman more seriously than a nonpregnant woman.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** Incidence based on small study population.

1% to 10%:

Cardiovascular: Hypertension (1%)

Central nervous system: Headache (1%)

Hepatic: Transaminases increased (1%)

Local: Injection site burning (1%)

Miscellaneous: Parvovirus B19 seropositive (3%)

Postmarketing and/or case reports: Peripheral ischemia, transient ischemic attack

Test InteractionsaPTT (formulation contains heparin)

Monitoring ParametersCoagulation factor assays, protein C, protein S, aPTT, PT, INR, CBC, AT, D-dimer, fibrinogen; transaminases; development of circulating coagulation factor antibodies (inhibitors); blood pressure, heart rate (before and during administration), temperature (during and following administration)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products the patient may be taking that may affect coagulation or platelet function. Assess results of laboratory tests (eg, prothrombin time, clotting factor assays) prior to and after therapy. Patient should be monitored continuously during and after therapy (eg, vital signs, cardiac and CNS status). Provide patient education according to patient condition.

Monitoring: Lab TestsCoagulation factor assays, protein C, protein S, aPTT, PT, INR, CBC, AT, D-dimer, fibrinogen; transaminases; development of circulating coagulation factor antibodies (inhibitors); blood pressure, heart rate (before and during administration), temperature (during and following administration)

Patient EducationThis medication can only be administered by infusion; report immediately any swelling, pain, burning, or itching at infusion site. Report acute headache, respiratory difficulty, chills, back pain, dizziness, nausea, or other unusual effects. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Octaplex®: Human coagulation factor II: 11-38 int. units/mL; factor VII: 9-24 int. units/mL; factor IX: 20-31 int. units/mL; factor X: 18-30 int. units/mL: protein C: 7-31 int. units/mL; protein S: 7-32 int. units/mL (20 mL) [contains heparin 4-15.5 int. units/mL, polysorbate 80 ≤50 mcg/mL, sodium citrate 17-27 mmoL/L; packaged with diluent]

Generic AvailableNo

ManufacturerOctapharma Canada, Inc

Mechanism of ActionProthrombin complex concentrate provides an increase in the levels of the vitamin K-dependent coagulation factors (II, VII, IX, and X) with the addition of protein C and protein S. Coagulation factors II, IX, and X are part of the intrinsic coagulation pathway, while factor VII is part of the extrinsic coagulation pathway. In the *extrinsic* pathway, damaged blood vessels release endothelial tissue factor (TF) which complexes with factor VII to form TF-factor VIIa. Within the *intrinsic* pathway, factor IX is converted to IXa. Factor IXa (as well as TF-factor VIIa) converts factor X to factor Xa in the final common pathway of coagulation. Factor Xa activates prothrombin (factor II) into thrombin (IIa) which converts fibrinogen into fibrin resulting in clot formation. Proteins C and S are vitamin K-dependent inhibiting enzymes involved in regulating the coagulation process. Protein S serves as a cofactor for protein C which is converted to activated protein C (APC). APC is a serine protease which inactivates factors Va and VIIIa, limiting thrombotic formation.

Pharmacodynamics/Kinetics

Onset of action: Rapid; significant INR decline within 10 minutes

Duration: ~6-8 hours

Half-life elimination: Factor II: 48–60 hours; Factor VII: 1.5-6 hours; Factor IX: 20-24 hours; Factor X: 24-48 hours; Protein C: 1.5–6 hours; Protein S: 24-48 hours

Note: Half-lives may be significantly reduced in severe hepatocellular damage, DIC, or extended catabolic metabolism.

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations**Management of intracerebral hemorrhage (ICH) due to warfarin:** Overall management of ICH is similar regardless of cause. However, iatrogenic spontaneous ICH may have specific treatments. Warfarin-related ICH should be treated with IV vitamin K at a dose of 10 mg given slowly (not to exceed 1 mg/minute) (Class I recommendation). It is important to also administer fresh frozen plasma (FFP) since vitamin K may take several hours to normalize INR. Other options besides FFP include prothrombin complex concentrate (PCC) which contains high levels of vitamin K-dependent factors (II, VII, and X) and factor IX complex which contains factors II, VII, IX, and X (Class IIb recommendation). Use of rFVIIa has shown promise for this indication. Advantages to rFVIIa include faster onset of action compared to FFP and vitamin K and a 50% lower volume is required compared to FFP. Disadvantages include a short half-life (~2.6 hours) requiring multiple doses to maintain a normalized INR and an increased risk of thromboembolic complications. Dosing of rFVIIa ranges between 15 and 90 mcg/kg. The use of factor containing products has a risk of thromboembolism.

Protirelin

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(proe TYE re lin)
U.S. Brand NamesThyrel® TRH [DSC]
Canadian Brand NamesRelefact® TRH
Pharmacologic CategoryDiagnostic Agent
Use: Labeled IndicationsAdjunct in the diagnostic assessment of thyroid function, and an adjunct to other diagnostic procedures in patients with pituitary or hypothalamic dysfunction; also causes release of prolactin from the pituitary and is used to detect defective control of prolactin secretion
Dosing: Adults**Diagnostic aid:** I.V.: 500 mcg (range 200-500 mcg)
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Diagnostic aid:** I.V.:

Infants and Children <6 years: Experience limited, but doses of 7 mcg/kg have been administered

Children 6-16 years: 7 mcg/kg to a maximum dose of 500 mcg

Administration: I.V.Administer I.V. bolus over 15-30 seconds with patient remaining in supine position; monitor blood pressure frequently during and 15 minutes after administration
ContraindicationsHypersensitivity to protirelin additives or any component of the formulation
Pregnancy Risk FactorC
Adverse Reactions

>10%:

Central nervous system: Headache, lightheadedness

Dermatologic: Flushing of face

Gastrointestinal: Nausea, xerostomia

Genitourinary: Urge to urinate

1% to 10%:

Central nervous system: Anxiety

Endocrine & metabolic: Breast enlargement and leaking in lactating women

Gastrointestinal: Bad taste in mouth, abdominal discomfort

Neuromuscular & skeletal: Tingling

Miscellaneous: Diaphoresis

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 500 mcg/mL (1 mL)

Generic AvailableNo
Mechanism of ActionIncrease release of thyroid stimulating hormone from the anterior pituitary
Pharmacodynamics/Kinetics

Onset of action: Peak effect: TSH: 20-30 minutes

Duration: TSH returns to baseline after ~3 hours

Half-life elimination, serum: Mean plasma: 5 minutes

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and unpleasant taste.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness is common; may cause anxiety
Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Vivactil® may be confused with Vyvanse™

Pronunciation(proe TRIP ti leen)

U.S. Brand NamesVivactil®

Pharmacologic CategoryAntidepressant, Tricyclic (Secondary Amine)

Use: Labeled IndicationsTreatment of depression

Dosing: Adults**Depression:** Oral: 15-60 mg/day in 3-4 divided doses

Dosing: ElderlyOral: Initial: 5-10 mg/day; increase every 3-7 days by 5-10 mg; usual dose: 15-20 mg/day

Dosing: Pediatric**Depression:** Oral: Adolescents: 15-20 mg/day

Dietary ConsiderationsMay be taken with food to decrease GI distress.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to protriptyline (cross-reactivity to other cyclic antidepressants may occur) or any component of the formulation; use of MAO inhibitors within 14 days; use of cisapride; use in a patient during the acute recovery phase of MI

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Protriptyline is FDA approved for the treatment of depression in adolescents.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May aggravate aggressive behavior or worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Protriptyline is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is moderate relative to other antidepressants.

- Hematologic effects: TCAs may rarely cause bone marrow suppression; monitor for any signs of infection and obtain CBC if symptoms (eg, fever, sore throat) evident.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is moderate relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is low relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with this agent is moderate-high relative to other antidepressants.
- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose regulation.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.
- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation due to concerns of pro-arrhythmogenesis.

Concurrent drug therapy issues:

- Anticholinergic and/or neuroleptic agents: Hyperpyrexia has been observed with TCAs in combination with anticholinergics and/or neuroleptics, particularly during hot weather.
- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Recommended to discontinue prior to elective surgery requiring general anesthesia. Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.
- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsLittle data on its use in the elderly. Strong anticholinergic properties which may limit its use; more often stimulating rather than sedating. Data from a clinical trial comparing fluoxetine to tricyclics suggest that fluoxetine is significantly less effective than nortriptyline in hospitalized elderly patients with unipolar major affective disorder, especially those with melancholia and concurrent cardiovascular diseases.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, heart block, hyper-/hypotension, MI, palpitation, stroke, tachycardia

Central nervous system: agitation, anxiety, ataxia, confusion, delirium, delusions, dizziness, drowsiness, EPS, exacerbation of psychosis, fatigue, hallucinations, headache, hypomania, incoordination, insomnia, nightmares, panic, restlessness, seizure

Dermatologic: Alopecia, itching, petechiae, photosensitivity, rash, urticaria

Endocrine & metabolic: Breast enlargement, galactorrhea, gynecomastia, increased or decreased libido, syndrome of inappropriate ADH secretion (SIADH)

Gastrointestinal: Anorexia, constipation, decreased lower esophageal sphincter tone may cause GE reflux, diarrhea, heartburn, increased appetite, nausea, trouble with gums, unpleasant taste, vomiting, weight gain/loss, xerostomia

Genitourinary: Difficult urination, impotence, testicular edema

Hematologic: Agranulocytosis, eosinophilia, leukopenia, purpura, thrombocytopenia

Hepatic: Cholestatic jaundice, increased liver enzymes

Neuromuscular & skeletal: Fine muscle tremor, numbness, tingling, tremor, weakness

Ocular: Blurred vision, eye pain, increased intraocular pressure

Otic: Tinnitus

Miscellaneous: Allergic reactions, excessive diaphoresis

Metabolism/Transport Effects**Substrate** of CYP2D6 (major)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Protriptyline may enhance the arrhythmogenic effect of Cisapride. *Risk X: Avoid combination*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Yohimbine: Tricyclic Antidepressants may increase the serum concentration of Yohimbine. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Grapefruit juice may inhibit the metabolism of some TCAs and clinical toxicity may result.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersMonitor for cardiac abnormalities in elderly patients receiving doses >20 mg; suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)

Reference RangeTherapeutic: 70-250 ng/mL (SI: 266-950 nmol/L); Toxic: >500 ng/mL (SI: >1900 nmol/L)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (see extensive list of Drug Interactions). Assess for suicidal tendencies before beginning therapy. May cause physiological or psychological dependence, tolerance, or abuse; periodically evaluate need for continued use. Assess therapeutic effectiveness (mental status, mood, affect) and adverse reactions (eg, suicidal ideation) at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing (allow 3-4 weeks between discontinuing this medication and starting another antidepressant). Caution patients with diabetes to monitor glucose levels closely; may increase or decrease serum glucose levels. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; take once-a-day dose at bedtime. Do not increase dose or frequency; may take 2-3 weeks to achieve desired results. This drug may cause physical and/or psychological dependence. Avoid alcohol and grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or disturbed taste (small frequent meals, good mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); urinary retention (void before taking medication); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report chest pain, palpitations, or rapid heartbeat; persistent adverse CNS effects (eg, suicidal ideation, nervousness, restlessness, insomnia, anxiety, excitation, headache, agitation, impaired coordination, changes in cognition); muscle cramping, weakness, tremors, or rigidity; blurred vision or eye pain; breast enlargement or swelling; yellowing of skin or eyes; or worsening of condition.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 5 mg, 10 mg

Vivactil®: 5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Vivactil)

5 mg (30): $81.61

10 mg (30): $107.26

Mechanism of ActionIncreases the synaptic concentration of serotonin and/or norepinephrine in the central nervous system by inhibition of their reuptake by the presynaptic neuronal membrane

Pharmacodynamics/Kinetics

Distribution: Crosses placenta

Protein binding: 92%

Metabolism: Extensively hepatic via N-oxidation, hydroxylation, and glucuronidation; first-pass effect (10% to 25%)

Half-life elimination: 54-92 hours (average: 74 hours)

Time to peak, serum: 24-30 hours

Excretion: Urine

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), unpleasant taste, and trouble with gums. Long-term treatment with TCAs, such as protriptyline, increases the risk of caries by reducing salivation and salivary buffer capacity.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Use with caution; epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs. Protriptyline is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health Comment Tricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal. Protriptyline is thought to have stimulating properties.

Index Terms Protriptyline Hydrochloride

Pronunciation

(soo doe e FED rin & KOE deen)

U.S. Brand NamesNotuss®-DC; Nucofed® [DSC]
Pharmacologic CategoryAntitussive/Decongestant
Use: Labeled IndicationsTemporary symptomatic relief of congestion and cough due to upper respiratory infections including common cold, bronchitis, sinusitis, and influenza
Dosing: Adults**Relief of congestion and cough:** Oral: One capsule every 6 hours as needed (maximum: 4 capsules/24 hours) **or** 5-10 mL every 4-6 hours as needed (maximum: 40 mL/24 hours)
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Relief of congestion and cough:** Oral:

Children 6-11 years: 2.5-5 mL every 4-6 hours as needed (maximum: 20 mL/24 hours)

Children ≥12 years: Refer to adult dosing.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).
RestrictionsCapsule: C-III; Liquid: C-V
ContraindicationsHypersensitivity to pseudoephedrine, codeine, or any component of the formulation; with or within 14 days of MAO-inhibitor therapy; severe cardiovascular disease (eg, hypertension, CAD, ischemic heart disease); newborns; premature infants; breast-feeding; pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Cardiovascular disease: Use with caution in patients with mild-to-moderate cardiovascular disease (including hypertension, CAD, and ischemic heart disease); contraindicated in patients with severe disease.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD, or other obstructive pulmonary disease; critical respiratory depression may occur, even at therapeutic dosages.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

- Ulcerative colitis: Use with caution in patients with chronic ulcerative colitis.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- CYP2D6 “ultrarapid metabolizers”: Use codeine with caution in patients with two or more copies of the variant CYP2D6*2 allele; may have extensive conversion to morphine and thus increased opioid-mediated effects.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

Other warnings/precautions:

- Cough control: Not recommended to use for cough control in patients with a chronic cough due to asthma, emphysema, or smoking. Should not be used in patients with excessive secretions.

- Patient education: Patients should notify healthcare provider if symptoms do not improve within 7 days or are accompanied by high fever. Patients should not exceed recommended doses.

Pregnancy Risk FactorC
Pregnancy ConsiderationsRefer to Codeine monograph.
LactationEnters breast milk/contraindicated
Breast-Feeding ConsiderationsRefer to Codeine monograph.
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, heart rate decreased/increased, hypertension, pallor, palpitation, tightness of chest

Central nervous system: Confusion, coordination impaired, dizziness, drowsiness, euphoria, excitation, fatigue, headache, hysteria, insomnia, irritability, lightheadedness, nervousness, neuritis, restlessness, sedation, seizure, vertigo

Dermatologic: Photosensitivity, pruritus, rash, urticaria

Endocrine & metabolic: Early menses

Gastrointestinal: Abdominal pain, anorexia, constipation, diarrhea, epigastric distress, nausea, vomiting

Genitourinary: Dysuria, polyuria, urinary retention

Neuromuscular & skeletal: Paresthesia, tremor, weakness

Ocular: Blurred vision, diplopia

Otic: Acute labyrinthitis, tinnitus

Respiratory: Dyspnea, nasal congestion, thickening of bronchial secretions, wheezing

Miscellaneous: Diaphoresis

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression); consuming ≥3 alcoholic drinks/day may increase the risk of liver damage

Herb/Nutraceutical: St John's wort may decrease codeine levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression). Avoid ephedra, yohimbe (may cause hypertension).

Test Interactions

Codeine may cause an elevation in serum amylase levels.

Pseudoephedrine interferes with urine detection of amphetamine (false-positive).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Nucofed®: Pseudoephedrine hydrochloride 60 mg and codeine phosphate 20 mg [DSC]

Liquid, oral:

Notuss®-DC: Pseudoephedrine hydrochloride 30 mg and codeine phosphate 10 mg per 5 mL (473 mL) [dye free, ethanol free, gluten free, sugar free; contains propylene glycol; bubblegum flavor]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Nucofed)

60-20 mg (30): $41.42

Syrup (Nucofed)

20-60 mg/5 mL (120): $25.99

Mechanism of Action

Pseudoephedrine directly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation

Codeine is an antitussive that controls cough by depressing the medullary cough center

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Codeine
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine or mepivacaine and levonordefrin (Carbocaine® 2% with Neo-Cobefrin®) to cause a pressor response.

Mental Health: Effects on Mental StatusMay cause sedation, dizziness, insomnia, nervousness, and restlessness

Mental Health: Effects on Psychiatric TreatmentMay cause CNS depression; concurrent use with psychotropics, valerian, kava kava, and gotu kola may produce additive effects. Codeine may cause psychological and physical dependence; use caution in patients with a history of substance abuse. St John's wort may decrease codeine levels.

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Pronunciation(soo doe e FED rin & deks troe meth OR fan)

U.S. Brand NamesPedia Relief Cough and Cold [OTC]; Pedia Relief Infants [OTC]; PediaCare® Infants' Decongestant & Cough [OTC] [DSC]; Sudafed® Children's Cold & Cough [OTC]; SudoGest Children's [OTC]

Canadian Brand NamesBalminil DM D; Benylin® DM-D; Koffex DM-D; Novahistex® DM Decongestant; Novahistine® DM Decongestant; Robitussin® Childrens Cough & Cold

Pharmacologic CategoryAntitussive/Decongestant

Use: Labeled IndicationsTemporary symptomatic relief of nasal congestion and cough due to common cold, hay fever, upper respiratory allergies

Dosing: Adults**Relief of nasal congestion and cough:**

General dosing guidelines base on pseudoephedrine component: Oral: 60 mg every 4-6 hours (maximum: 240 mg/24 hours)

Product-specific dosing: Oral: Sudafed® Children's Cold & Cough: 20 mL every 4 hours (maximum: 80 mL/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Relief of nasal congestion and cough:**

General dosing guidelines base on pseudoephedrine component: Oral:

Children 2-6 years: 15 mg every 4-6 hours (maximum: 60 mg/24 hours)

Children 6-12 years: 30 mg every 4-6 hours (maximum: 120 mg/24 hours)

Children ≥12 years and Adults: 60 mg every 4-6 hours (maximum: 240 mg/24 hours)

Product-specific dosing: Oral:

Children 2-6 years (Sudafed® Children's Cold & Cough): 5 mL every 4 hours (maximum: 20 mL/24 hours)

Children 6-12 years (Sudafed® Children's Cold & Cough): 10 mL every 4 hours (maximum: 40 mL/24 hours)

Children ≥12 years: Refer to adult dosing.

Dietary ConsiderationsTriaminic® Cough contains sodium 20 mg/5 mL. Triaminic® Cough and Nasal Congestion contains sodium 7 mg/5 mL. Vicks® 44D Cough & Head Congestion contains sodium 10.3 mg/5 mL. PediaCare® Children's Long Acting Cough Plus Cold contains phenylalanine 5 mg per tablet.

ContraindicationsHypersensitivity to pseudoephedrine, dextromethorphan, or any component of the formulation; use with or within 14 days of MAO inhibitor therapy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (hypertension or ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Not for OTC use in children <2 years of age.

Other warnings/precautions:

- Self-medication (OTC use): When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever, rash, or persistent headache. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur.

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsDextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid:

Sudafed® Children's Cold & Cough: Pseudoephedrine hydrochloride 15 mg and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL) [alcohol free, sugar free; contains sodium benzoate; cherry berry flavor]

Liquid, oral [drops]:

PediaCare® Infants' Decongestant & Cough: Pseudoephedrine hydrochloride 7.5 mg and dextromethorphan hydrobromide 2.5 mg per 0.8 mL (15 mL) [alcohol free; contains sodium benzoate; cherry flavor] [DSC]

Pedia Relief Infants: Pseudoephedrine hydrochloride 7.5 mg and dextromethorphan hydrobromide 2.5 mg per 0.8 mL (15 mL) [cherry flavor]

Syrup:

Pedia Relief Cough and Cold: Pseudoephedrine hydrochloride 15 mg and dextromethorphan hydrobromide 7.5 mg per 5 mL (120 mL) [cherry flavor]

SudoGest Children's: Pseudoephedrine hydrochloride 15 mg and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL)

Generic AvailableYes: Liquid drops, syrup

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Dextromethorphan
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

http://www.fda.gov/medwatch/safety/2008/safety08.htm#cough

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Pronunciation(soo doe e FED rin & eye byoo PROE fen)
U.S. Brand NamesAdvil® Cold & Sinus [OTC]; Advil® Cold, Children's [OTC] [DSC]; Proprinal® Cold and Sinus [OTC]
Canadian Brand NamesAdvil® Cold & Sinus; Children's Advil® Cold; Sudafed® Sinus Advance
Pharmacologic CategoryDecongestant/Analgesic
Use: Labeled IndicationsFor temporary relief of cold, sinus and flu symptoms (including nasal congestion, sinus pressure, headache, minor body aches and pains, and fever)

Dosing: Adults**Analgesic/decongestant (OTC labeling):** Oral: Ibuprofen 200 mg and pseudoephedrine 30 mg per dose: One dose every 4-6 hours as needed; may increase to 2 doses if necessary (maximum: 6 doses/24 hours). Contact healthcare provider if symptoms have not improved within 7 days when treating cold symptoms or within 3 days when treating fever.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Analgesic/decongestant (OTC labeling):** Oral: Children ≥12 years: Refer to adult dosing.

Administration: OralMay be administered with food or milk if stomach upset occurs.

Dietary ConsiderationsMay be taken with food or milk if stomach upset occurs.

StorageStore at 20°C to 25ºC (68°F to 77°F); avoid excessive heat.

ContraindicationsHypersensitivity to ibuprofen, pseudoephedrine, or any component of the formulation; hypersensitivity to aspirin or other NSAIDs; use with or within 2 weeks of discontinuing MAO inhibitor; immediately prior to or after coronary bypass graft (CABG)

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.

- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.

- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.

- Cardiovascular events: NSAIDs are associated with an increased risk of adverse cardiovascular events, including MI, stroke, and new onset or worsening of pre-existing hypertension. Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation. These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol (≥3 alcoholic beverages/day), the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue at the first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: Use is contraindicated when used immediately prior to or after coronary artery bypass graft (CABG) surgery. Risk of MI and stroke may be increased with use following CABG surgery.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or urinary obstruction.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Not for self-medication (OTC use) in children <12 years of age.

Other warnings/precautions:

- Self-medication (OTC use): Prior to self-medication, patients should contact healthcare provider if they have had recurring stomach pain or upset, ulcers, bleeding problems, asthma, high blood pressure, heart or kidney disease, thyroid disease, diabetes, glaucoma, enlarged prostate, other serious medical problems, are currently taking a diuretic, aspirin, anticoagulant, or are ≥60 years of age. Recommended dosages should not be exceeded, due to an increased risk of GI bleeding. Stop use and consult a healthcare provider if symptoms get worse, newly appear, or continue; if an allergic reaction occurs; if nervousness, dizziness, or sleeplessness occurs; or if fever lasts for >3 days, congestion lasts for >7 days, or pain >10 days. Consuming ≥3 alcoholic beverages/day or taking longer than recommended may increase the risk of GI bleeding.

Pregnancy Risk FactorIbuprofen: B/D (3rd trimester)
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsIbuprofen: **Substrate** (minor) of CYP2C9, 2C19; **Inhibits** CYP2C9 (strong)
Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet:

Advil® Cold and Sinus, Proprinal® Cold and Sinus: Pseudoephedrine hydrochloride 30 mg and ibuprofen 200 mg

Capsule, liquid filled:

Advil® Cold and Sinus: Pseudoephedrine hydrochloride 30 mg and ibuprofen 200 mg [solubilized ibuprofen as free acid and potassium salt; contains potassium 20 mg/capsule and coconut oil]

Suspension:

Advil® Cold, Children's: Pseudoephedrine hydrochloride 15 mg and ibuprofen 100 mg per 5 mL (120 mL) [alcohol free; contains sodium 3 mg/5 mL and sodium benzoate; grape flavor] [DSC]

Generic AvailableYes: Caplet

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDizziness, drowsiness, nervousness, and insomnia are common; may rarely cause hallucinations, insomnia, confusion, or depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors; may rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Index TermsIbuprofen and Pseudoephedrine

International Brand NamesAdvil Cold & Sinus (IL); Advil Cold-Sinus (EC); Arinac (IN); Brenfed (IN); Dristan Sinus (CO); Nurofen Cold & Flu (ZA); Rhinureflex (FR); Tri-Profen Cold and Flu (AU)

Pronunciation(soo doe e FED rin & meth skoe POL a meen)
U.S. Brand NamesAlleRx™-D; Amdry-D; Extendryl PSE
Pharmacologic CategoryDecongestant/Anticholingeric Combination
Use: Labeled IndicationsRelief of symptoms of allergic rhinitis, vasomotor rhinitis, sinusitis, and the common cold
Dosing: AdultsOral (Allerx™-D, Amdry-D): One tablet every 12 hours (maximum: 2 tablets/24 hours)
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥12 years: Refer to adult dosing.
StorageStore at controlled room temperature between 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to pseudoephedrine, methscopolamine, or any component of the formulation; severe hypertension; severe coronary artery disease; use with or within 2 weeks of discontinuing MAO inhibitor; narrow-angle glaucoma; urinary retention; peptic ulcer disease; during an asthmatic attack
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression and blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with renal impairment.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.
- Ulcerative colitis: Use with caution in patients with ulcerative colitis.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies with this combination have not been conducted; see individual agents
LactationExcretion in breast milk unknown/ not recommended
Breast-Feeding ConsiderationsPseudoephedrine is excreted in breast milk. Excretion of methscopolamine is unknown. See individual agents.
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, bradycardia, cardiovascular collapse, flushing, hypotension, pallor, palpitation, tachycardia

Central nervous system: Anxiety, convulsions, CNS depression, dizziness, drowsiness, excitability, fear, giddiness, hallucination, headache, insomnia, irritability, lassitude, nervousness, restlessness

Gastrointestinal: Gastric irritation, nausea, xerostomia

Genitourinary: Dysuria, urinary retention

Neuromuscular & skeletal: Tremor, weakness

Ocular: Blurred vision

Respiratory: Respiratory difficulty

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agent for Pseudoephedrine.

Patient EducationSee individual agent for Pseudoephedrine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Pseudoephedrine hydrochloride 120 mg and methscopolamine nitrate 2.5 mg

Allerx™-D, Amdry-D: Pseudoephedrine hydrochloride 120 mg and methscopolamine nitrate 2.5 mg

Tablet, extended release:

Extendryl PSE: Pseudoephedrine hydrochloride 120 mg and methscopolamine nitrate 2.5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (AlleRx-D)

120-2.5 mg (60): $151.79

Mechanism of Action

Pseudoephedrine: Acts as a decongestant in respiratory tract mucous membranes.

Methscopolamine nitrate: Derivative of scopolamine; a peripheral anticholinergic agent

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Methscopolamine: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and dry throat and nose. Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause sedation, anxiety, dizziness, drowsiness, excitability, hallucinations, insomnia, irritability, nervousness, and restlessness

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor therapy. Concomitant use with psychotropics may produce additive anticholinergic and sedative effects especially in the elderly.

Index TermsMethscopolamine and Pseudoephedrine; Pseudoephedrine hydrochloride and Methscopolamine Nitrate

---

Pseudoephedrine, Dihydrocodeine, and Chlorpheniramine

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Pronunciation(soo doe e FED rin, dye hye droe KOE deen, & klor fen IR a meen)

U.S. Brand NamesColdcough; DiHydro-CP; Hydro-Tussin™ DHC [DSC]; Pancof® [DSC]; Uni-Cof [DSC]

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of cough, congestion, and sneezing due to colds, respiratory infections, or hay fever

Dosing: Adults**Cough and congestion:** Oral: 5-10 mL every 4-6 hours; do not exceed 4 doses in 24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cough and congestion:** Oral: Children:

2-6 years: 1.25-2.5 mL every 4-6 hours; do not exceed 4 doses in 24 hours

6-12 years: 2.5-5 mL every 4-6 hours; do not exceed 4 doses in 24 hours

>12 years: Refer to adult dosing.

Dietary ConsiderationsSee individual agents.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsC-III

ContraindicationsHypersensitivity to pseudoephedrine, dihydrocodeine, codeine, chlorpheniramine (or related substances), or any component of the formulation; narrow-angle glaucoma; severe hypertension, severe cardiovascular disease; during or within 14 days of MAO inhibitor therapy; urinary retention; peptic ulcer; status asthmaticus; severe respiratory depression; infants; pregnancy; breast-feeding

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients not able to maintain blood pressure.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination product. Opioid analgesics are considered FDA risk category D if used for prolonged periods or in large doses near term. Withdrawal symptoms may be observed in babies born to mothers taking opioids regularly during pregnancy. Respiratory depression may be observed in the newborn if opioids are given close to delivery.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsPseudoephedrine enters breast milk (AAP rates “compatible”). Information is not available for hydrocodone; codeine and other opioids are excreted in breast milk and the AAP considers codeine to be “compatible” with breast-feeding. Data is not available for chlorpheniramine. The manufacturers recommend discontinuing the medication or to discontinue nursing during therapy

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Dihydrocodeine: **Substrate** of CYP2D6 (minor)

Chlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); Inhibits CYP2D6 (weak).

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May diminish the analgesic effect of Dihydrocodeine. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Syrup:

Coldcough, Hydro-Tussin™ DHC [DSC], Pancof® [DSC], Uni-Cof [DSC]: Pseudoephedrine hydrochloride 15 mg, dihydrocodeine bitartrate 7.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; grape flavor]

DiHydro-CP: Pseudoephedrine hydrochloride 15 mg, dihydrocodeine bitartrate 7.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [grape flavor]

Generic Available Yes

Mechanism of Action

Pseudoephedrine: Directly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation

Dihydrocodeine: Binds to opiate receptors in the CNS; suppresses cough in medullary center

Chlorpheniramine: Competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Pharmacodynamics/Kinetics See individual agents.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment:

Chlorpheniramine: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Pseudoephedrine: Xerostomia (prolonged use worsens; normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Use with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental Status Sedation is common

Mental Health: Effects on Psychiatric Treatment Contraindicated with or within 14 days of MAO inhibitor therapy. Fluoxetine, paroxetine, and ropinirole may decrease the effects of dihydrocodeine. Nefazodone may increase the effects of chlorpheniramine. Concomitant use with psychotropics may produce additive sedative and anticholinergic effects.

Mental Health Comment May cause paradoxical excitation in some patients. Chlorpheniramine is highly sedative and anticholinergic. Alternative therapy should be considered in the elderly.

Index Terms Chlorpheniramine, Pseudoephedrine, and Dihydrocodeine; Dihydrocodeine Bitartrate, Pseudoephedrine Hydrochloride, and Chlorpheniramine Maleate; Pseudoephedrine, Chlorpheniramine, and Dihydrocodeine

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state "Do not use in children under four years of age." In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Atuss® HD: Pseudoephedrine hydrochloride 30 mg [sustained release], hydrocodone bitartrate 5 mg [immediate release], and chlorpheniramine maleate 2 mg [sustained release] [DSC]

Liquid:

Detuss: Pseudoephedrine hydrochloride 30 mg, hydrocodone bitartrate 5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free; vanilla flavor] [DSC]

Hydron PSC: Pseudoephedrine hydrochloride 30 mg, hydrocodone bitartrate 5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [vanilla flavor] [DSC]

Syrup:

Coldcough HC: Pseudoephedrine hydrochloride 15 mg, hydrocodone bitartrate 3 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; grape flavor] [DSC]

Hyphed: Pseudoephedrine hydrochloride 30 mg, hydrocodone bitartrate 2.5 mg, and chlorpheniramine maleate 2 mg per 5 mL (480 mL) [contains alcohol 5%; raspberry flavor] [DSC]

Generic AvailableYes: Excludes capsule, tablet
Pricing: U.S. (www.drugstore.com)

Liquid (Hydron PSC)

30-2-5 mg/5 mL (473): $30.98

Syrup (Hydro-Tussin HC)

15-2-3 mg/5 mL (473): $36.99

Syrup (Q-V Tussin)

30-2-2.5 mg/5 mL (480): $16.99

Tablets (Tussend)

4-5-60 mg (30): $34.99

Mechanism of Action

Pseudoephedrine: Directly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation

Hydrocodone: Binds to opiate receptors in the CNS; suppresses cough in medullary center

Chlorpheniramine: Competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Chlorpheniramine
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response
Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, nervousness, insomnia, and sedation; may rarely cause hallucinations
Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors; concurrent use with psychotropics may produce additive sedation and dry mouth; may result in loss of pain control if used with fluoxetine and paroxetine
Index TermsChlorpheniramine, Pseudoephedrine, and Hydrocodone; Hydrocodone, Chlorpheniramine, and Pseudoephedrine; Pseudoephedrine Hydrochloride, Hydrocodone Bitartrate, and Chlorpheniramine Maleate

Special Alerts

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Medication Safety Issues

Sound-alike/look-alike issues:

Dimetapp® may be confused with Dermatop®, Dimetabs®, Dimetane®

Sudafed® may be confused with Sufenta®

Pronunciation(soo doe e FED rin)

U.S. Brand NamesGenaphed® [OTC]; Kidkare Decongestant [OTC]; Nasofed™; Oranyl [OTC]; Silfedrine Children's [OTC]; Sudafed® 12 Hour [OTC]; Sudafed® 24 Hour [OTC]; Sudafed® Children's [OTC]; Sudafed® Maximum Strength Nasal Decongestant [OTC]; Sudo-Tab® [OTC]; SudoGest [OTC]; Unifed [OTC]

Canadian Brand NamesBalminil Decongestant; Benylin® D for Infants; Contac® Cold 12 Hour Relief Non Drowsy; Drixoral® ND; Eltor®; PMS-Pseudoephedrine; Pseudofrin; Robidrine®; Sudafed® Decongestant

Pharmacologic CategoryAlpha/Beta Agonist

Use: Labeled IndicationsTemporary symptomatic relief of nasal congestion due to common cold, upper respiratory allergies, and sinusitis; also promotes nasal or sinus drainage

Use: DentalTemporary symptomatic relief of nasal congestion due to common cold, upper respiratory allergies, and sinusitis; also promotes nasal or sinus drainage

Dosing: Adults**Nasal congestion:** Oral:

Hydrochloride salt: General dosing guidelines: 30-60 mg every 4-6 hours, sustained release: 120 mg every 12 hours; maximum: 240 mg/24 hours

Tannate salt (Nasofed™ oral suspension): 5-10 mL (50-100 mg) every 12 hours

Dosing: ElderlyNasal congestion: Use caution in this population; initiate using immediate release formulation: Hydrochloride salt: 30-60 mg every 6 hours as needed

Dosing: Pediatric**Nasal congestion:** Oral:

Hydrochloride salt: General dosing guidelines:

Children:

<2 years: 4 mg/kg/day in divided doses every 6 hours

2-5 years: 15 mg every 4-6 hours; maximum: 60 mg/24 hours

6-12 years: 30 mg every 4-6 hours; maximum: 120 mg/24 hours

Tannate salt (Nasofed™ oral suspension):

Children 2-5 years: 1.25-2.5 mL (12.5-25 mg) every 12 hours

Children 6-11 years: 2.5-5 mL (25-50 mg) every 12 hours

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentConsider reducing dose.

Administration: OralDo not crush extended release drug product, swallow whole.

Dietary ConsiderationsShould be taken with water or milk to decrease GI distress. Nasofed™ oral suspension contains phenylalanine 7 mg/5 mL; Sudafed® Children's chewable tablet contains phenylalanine 0.78 mg/tablet.

ContraindicationsHypersensitivity to pseudoephedrine or any component of the formulation; with or within 14 days of MAO inhibitor therapy; newborns; breast-feeding

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use caution in patient with renal impairment; consider dosage adjustments.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Self-medication (OTC use): When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur. Not for OTC use in children <2 years of age.

Geriatric ConsiderationsElderly patients should be counseled about the proper use of over-the-counter cough and cold preparations. Elderly are more predisposed to adverse effects of sympathomimetics since they frequently have cardiovascular diseases and diabetes mellitus as well as multiple drug therapies. It may be advisable to treat with a short-acting/immediate-release formulation before initiating sustained-release/long-acting formulations.

Pregnancy Risk FactorC

Pregnancy ConsiderationsUse during the 1st trimester may be associated with a possible risk of gastroschisis, small intestinal atresia, and hemifacial microsomia due pseudoephedrine's vasoconstrictive effects. However, additional studies are needed to define the magnitude of risk.

LactationEnters breast milk/use caution (AAP rates "compatible")

Breast-Feeding ConsiderationsPseudoephedrine is excreted in breast milk. Animal reproduction studies have not been conducted. Some manufacturers contraindicate its use; however, the AAP considers it to be "compatible" with breast-feeding.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, hypotension, palpitation, tachycardia

Central nervous system: Chills, confusion, coordination impaired, dizziness, drowsiness, excitability, fatigue, hallucination, headache, insomnia, nervousness, neuritis, restlessness, seizure, transient stimulation, vertigo

Dermatologic: Photosensitivity, rash, urticaria

Gastrointestinal: Anorexia, constipation, diarrhea, dry throat, nausea, vomiting, xerostomia

Genitourinary: Difficult urination, dysuria, polyuria, urinary retention

Hematologic: Agranulocytosis, hemolytic anemia, thrombocytopenia

Neuromuscular & skeletal: Tremor, weakness

Ocular: Blurred vision, diplopia

Otic: Tinnitus

Respiratory: Chest/throat tightness, dry nose, dyspnea, nasal congestion, thickening of bronchial secretions, wheezing

Miscellaneous: Anaphylaxis, diaphoresis

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Onset of effect may be delayed if pseudoephedrine is taken with food.

Herb/Nutraceutical: Avoid ephedra, yohimbe (may cause hypertension).

Test InteractionsInterferes with urine detection of amphetamine (false-positive)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake only as prescribed; do not exceed prescribed dose or frequency. Do not chew or crush timed release forms. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nervousness, insomnia, dizziness, or drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report persistent CNS changes (dizziness, tremor, agitation, or convulsions); respiratory difficulty; chest pain, palpitations, or rapid heartbeat; muscle tremor; or lack of improvement or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet, extended release, as hydrochloride:

Sudafed® 12 Hour: 120 mg

Liquid, as hydrochloride: 30 mg/5 mL (120 mL)

Silfedrine Children's: 15 mg/5 mL (120 mL, 480 mL) [alcohol and sugar free; grape flavor]

Sudafed® Children's: 15 mg/5 mL (120 mL) [alcohol and sugar free; contains sodium benzoate; grape flavor]

Unifed: 30 mg/5 mL (120 mL, 480 mL, 3840 mL)

Liquid, oral, as hydrochloride [drops]:

Kidkare Decongestant: 7.5 mg/0.8 mL (30 mL) [alcohol free; contains benzoic acid and sodium benzoate; cherry flavor]

Suspension, oral, as tannate:

Nasofed™: 50 mg/5 mL (118 mL) [contains phenylalanine 7 mg/5 mL, propylene glycol; strawberry flavor]

Syrup, as hydrochloride: 30 mg/5 mL (118 mL, 473 mL)

Tablet, as hydrochloride: 30 mg, 60 mg

Genaphed®, Oranyl, Sudafed®, Sudo-Tab®: 30 mg

SudoGest: 30 mg, 60 mg

Tablet, chewable, as hydrochloride:

Sudafed® Children's: 15 mg [sugar free; contains phenylalanine 0.78 mg/tablet; orange flavor]

Tablet, extended release, as hydrochloride:

Sudafed® 24 Hour: 240 mg

Generic AvailableYes: Liquid, tablet

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Sudafed 24 Hour Non-Drowsy)

240 mg (10): $19.87

Tablets (Pseudoephedrine HCl)

60 mg (100): $10.13

Mechanism of ActionDirectly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation, increased heart rate and contractility

Pharmacodynamics/Kinetics

Onset of action: Decongestant: Oral: 15-30 minutes

Duration: Immediate release tablet: 4-6 hours; Extended release: ≤12 hours

Absorption: Rapid

Metabolism: Partially hepatic

Half-life elimination: 9-16 hours

Excretion: Urine (70% to 90% as unchanged drug, 1% to 6% as active norpseudoephedrine); dependent on urine pH and flow rate; alkaline urine decreases renal elimination of pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDizziness, drowsiness, nervousness, and insomnia are common; may rarely cause hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors

Index Terms*d*-Isoephedrine Hydrochloride; Pseudoephedrine Hydrochloride; Pseudoephedrine Sulfate

Medication Safety Issues

Sound-alike/look-alike issues:

Fiberall® may be confused with Feverall®

Hydrocil® may be confused with Hydrocet®

Modane® may be confused with Matulane®, Moban®

Pronunciation(SIL i yum)
U.S. Brand NamesBulk-K [OTC]; Fiberall®; Fibro-Lax [OTC]; Fibro-XL [OTC]; Genfiber™ [OTC]; Hydrocil® Instant [OTC]; Konsyl-D™ [OTC]; Konsyl® Easy Mix™ [OTC]; Konsyl® Orange [OTC]; Konsyl® Original [OTC]; Konsyl® [OTC]; Metamucil® Plus Calcium [OTC]; Metamucil® Smooth Texture [OTC]; Metamucil® [OTC]; Natural Fiber Therapy Smooth Texture [OTC]; Natural Fiber Therapy [OTC]; Reguloid [OTC]
Canadian Brand NamesMetamucil®
Pharmacologic CategoryAntidiarrheal; Laxative, Bulk-Producing
Use: Labeled IndicationsOTC labeling: Dietary fiber supplement; treatment of occasional constipation; reduce risk of coronary heart disease (CHD)
Use: Unlabeled/InvestigationalTreatment of diarrhea, chronic constipation, irritable bowel syndrome, inflammatory bowel disease, colon cancer, or diabetes
Dosing: AdultsGeneral dosing guidelines; consult specific product labeling.

Adequate intake for total fiber: Oral: **Note:** The definition of "fiber" varies, however, the soluble fiber in psyllium is only one type of fiber which makes up the daily recommended intake of total fiber.

Adults 19-50 years: Male: 38 g/day; Female: 25 g/day

Adults ≥51 years: Male: 30 g/day; Female: 21 g/day

Pregnancy: 28 g/day

Lactation: 29 g/day

Constipation: Oral: Psyllium: 2.5-30 g per day in divided doses

Reduce risk of CHD: Oral: Soluble fiber ≥7 g (psyllium seed husk ≥10.2 g) per day

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricGeneral dosing guidelines; consult specific product labeling.

Adequate intake for total fiber: Oral: **Note:** The definition of "fiber" varies, however, the soluble fiber in psyllium is only one type of fiber which makes up the daily recommended intake of total fiber.

Children 1-3 years: 19 g/day

Children 4-8 years: 25 g/day

Children 9-13 years: Male: 31 g/day; Female: 26 g/day

Children 14-18 years: Male: 38 g/day; Female: 26 g/day

Constipation: Oral:

Children 6-11 years: Psyllium: 1.25-15 g per day in divided doses

Children ≥12 years: Refer to adult dosing.

Reduce risk of CHD: Oral: Children ≥12 years: Refer to adult dosing.

Administration: OralInhalation of psyllium dust may cause sensitivity to psyllium (eg, runny nose, watery eyes, wheezing). Drink at least 8 ounces of liquid with each dose. Powder must be mixed in a glass of water or juice. Capsules should be swallowed one at a time. When more than one dose is required, they should be divided throughout the day. Separate dose by at least 2 hours from other drug therapies.
Dietary ConsiderationsProducts should be taken with at least 8 ounces of fluids. Some products contain dextrose, sucrose, calcium, potassium, phenylalanine, as well as additional ingredients. Check individual product information for caloric and nutritional value.

When used to reduce the risk of CHD, the amount of **soluble fiber** from psyllium should be ≥7 g/day and it should be used in conjunction with a diet low in saturated fat and cholesterol.

Fiberall® contains phenylalanine.

Metamucil® Smooth Texture orange flavor, sugar free formulation contains phenylalanine 25 mg per teaspoonful. Metamucil® Smooth Texture berry burst flavor contains phenylalanine 16 mg per teaspoonful. Metamucil® Smooth Texture pink lemonade flavor, sugar free formulation contains phenylalanine 19 mg per teaspoonful. Metamucil® wafers contain soy lecithin. Konsyl® Orange sugar free contains calcium 6 mg, phenylalanine 21 mg, potassium 31 mg, and sodium 3 mg per teaspoon.

ContraindicationsHypersensitivity to psyllium or any component of the formulation; fecal impaction; GI obstruction
Warnings/Precautions

Disease-related concerns:

- Coronary heart disease (CHD): To reduce the risk of CHD, the soluble fiber from psyllium should be used in conjunction with a diet low in saturated fat and cholesterol.

- Gastrointestinal disease: Use with caution in patients with esophageal strictures, ulcers, stenosis, or intestinal adhesions or difficulty swallowing

Special populations:

- Elderly: Use with caution in the elderly; may have insufficient fluid intake which may predispose them to fecal impaction and bowel obstruction.

Dosage form specific issues:

- Calcium: Some products may contain calcium.

- Phenylalanine: Some products may contain phenylalanine.

- Potassium: Some products may contain potassium.

- Sodium: Some products may contain sodium.

- Soy lecithin: Some products may contain soy lecithin.

Other warnings/precautions:

- Administration: Products must be taken with at least 8 ounces of fluid in order to prevent choking.

- Self-medication (OTC use): When used for self-medication (OTC), do not use in the presence of abdominal pain, nausea, or vomiting. Notify healthcare provider in case of sudden changes of bowel habits which last >2 weeks or in case of rectal bleeding. Not for self-treatment of constipation lasting >1 week.

Geriatric ConsiderationsElderly may have insufficient fluid intake which may predispose them to fecal impaction and bowel obstruction. Patients should have a 1 month trial, with at least 14 g/day, before effects in bowel function are determined. Bloating and flatulence are mostly a problem in first 4 weeks of therapy. See Warnings/Precautions.
Adverse ReactionsFrequency not defined.

Gastrointestinal: Abdominal cramps, constipation, diarrhea, esophageal or bowel obstruction

Respiratory: Bronchospasm

Miscellaneous: Anaphylaxis upon inhalation in susceptible individuals, rhinoconjunctivitis

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringTeach patient proper use (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationTake as directed. Powder: Mix in large glass of water or juice (8 oz or more) and drink immediately. Maintain adequate hydration (2-3 L/day of fluids), unless instructed to restrict fluid intake. Mix carefully; do not inhale powder. Separate this medication from other medications by at least 1 hour. Results may begin in 12 hours; full results may take 2-3 days. Do not increase dose. Report persistent constipation; watery diarrhea; difficulty, pain, or choking with swallowing; respiratory difficulty; or unusual coughing.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Fibro XL: 0.675 g [sugar free; provides dietary fiber 3.8 g and soluble fiber 3 g per 7 capsules]

Genfiber™: 0.52 g [provides dietary fiber 3 g and soluble fiber 2 g per 6 capsules]

Konsyl®: 0.52 g [sugar free; contains calcium 8 mg, potassium <11 mg and sodium 1 mg per capsule; provides dietary fiber 3 g and soluble fiber 2 g per 5 capsules]

Metamucil®: 0.52 g [contains potassium 5 mg/capsule; provides dietary fiber 3 g and soluble fiber 2.1 g per 6 capsules]

Metamucil® Plus Calcium: 0.52 g [contains calcium 60 mg and potassium 6 mg per capsule; provides dietary fiber 3 g and soluble fiber 2.1 g per 5 capsules]

Reguloid: 0.52 g [provides dietary fiber 3 g and soluble fiber 2 g per 6 capsules]

Powder:

Bulk-K: 4.7 g/teaspoon (392 g) [provides dietary fiber 3.8 g and soluble fiber 3 g per teaspoon]

Fiberall®: 0.05 g/tablespoon (454 g) [sugar free; contains phenylalanine; psyllium is in combination with other fiber sources providing total dietary fiber 3.5 g and soluble fiber 2 g per tablespoon; also contains vitamins and minerals; orange flavor]

Fibro-Lax: 4.7 g/teaspoon (140 g, 392 g) [provides dietary fiber 3.8 g and soluble fiber 3 g per teaspoon]

Genfiber®:

3.4 g/tablespoon (397 g) [contains sodium ≤5 mg tablespoon; provides dietary fiber 3 g and soluble fiber 2 g per tablespoon; orange flavor]

Hydrocil® Instant:

3.5 g/packet (30s, 500s) [sugar free; provides dietary fiber 3 g and soluble fiber 2.4 g per packet]

3.5 g/teaspoon (300 g) [sugar free; provides dietary fiber 3 g and soluble fiber 2.4 g per teaspoon]

Konsyl®: Original:

6 g/packet (30s, 100s, 500s) [sugar free; contains calcium 10 mg, sodium 5 mg, and potassium 55 mg per packet; provides dietary fiber 5 g and soluble fiber 3 g per packet]

6 g/teaspoon (300 g, 450 g) [sugar free; contains calcium 10 mg, sodium 5 mg, and potassium 55 mg per teaspoon; provides dietary fiber 5 g and soluble fiber 3 g per teaspoon]

Konsyl-D™:

3.4 g/packet (100s, 500s) [contains calcium 6 mg, dextrose 3.1 g, potassium 31 mg and sodium 3 mg per packet; provides dietary fiber 3 g and soluble fiber 2 g per packet]

3.4 g/teaspoon (325 g, 397 g, 500 g) [contains calcium 6 mg, dextrose 3.1 g, potassium 31 mg, and sodium 3 mg per teaspoon; provides dietary fiber 3 g and soluble fiber 2 g per teaspoon]

Konsyl® Easy Mix:

6 g/packet (500s) [sugar free; contains calcium 10 mg, potassium 55 mg, and sodium 5 mg per packet; provides dietary fiber 5 g and soluble fiber 3 g per packet]

6 g/teaspoon (250 g) [sugar free; contains calcium 10 mg, potassium 55 mg, and sodium 5 mg per teaspoon; provides dietary fiber 5 g and soluble fiber 3 g per teaspoon]

Konsyl® Orange:

3.4 g/packet (30s) [contains calcium 6 mg, potassium 31 mg, sodium 3 mg, and sucrose 8g per packet; provides dietary fiber 3 g and soluble fiber 2 g per packet; orange flavor]

3.4 g/tablespoon (538 g) [contains calcium 6 mg, potassium 31 mg, sodium 3 mg, and sucrose 8g per tablespoon; provides dietary fiber 3 g and soluble fiber 2 g per tablespoon; orange flavor]

3.4 g/teaspoon (425 g) [sugar free; contains calcium 6 mg, phenylalanine 21 mg, potassium 31 mg, and sodium 3 mg per teaspoon; provides dietary fiber 3 g and soluble fiber 2 g per teaspoon; orange flavor]

Metamucil®:

3.4 g/teaspoon (390 g, 570 g, 870 g) [contains sodium 5 mg and potassium 30 mg per teaspoon; provides dietary fiber 3 g and soluble fiber ~2 g per teaspoon; unflavored]

3.4g/tablespoon (570 g, 870 g, 1254 g) [contains sodium 5 mg and potassium 30 mg per tablespoon; provides dietary fiber 3 g and soluble fiber ~2 g per tablespoon; orange flavor]

Metamucil® Smooth Texture:

3.3 g/teaspoon (288 g, 432 g, 684 g) [sugar free; contains phenylalanine 19 mg, potassium 35 mg, and sodium 5 mg per teaspoon; provides dietary fiber 3 g and soluble fiber ~2 g per teaspoon; pink lemonade flavor]

3.4 g/packet (30s) [contains sodium 5 mg and potassium 30 mg per packet; provides dietary fiber 3 g and soluble fiber ~2 g per packet; orange flavor]

3.4 g/packet (30s) [sugar free; contains phenylalanine 16 mg, sodium 5 mg, and potassium 30 mg per packet; provides dietary fiber 3 g and soluble fiber ~2 g per packet; berry burst flavor]

3.4 g/packet (30s) [sugar free; contains phenylalanine 25 mg, sodium 5 mg, and potassium 30 mg per packet; provides dietary fiber 3 g and soluble fiber ~2 g per packet; orange flavor]

3.4 g/tablespoon (609 g, 912 g, 1368g 1446 g) [contains sodium 5 mg and potassium 30 mg per dose tablespoon; provides dietary fiber 3 g and soluble fiber ~2 g per tablespoon; orange flavor]

3.4 g/teaspoon (300 g, 450 g, 690 g) [sugar free; contains sodium 5 mg and potassium 30 mg per dose teaspoon; provides dietary fiber 3 g and soluble fiber ~2 g per teaspoon; unflavored]

3.4 g/teaspoon (173 g, 300 g, 450 g, 660 g, 1020 g) [sugar free; contains phenylalanine 25 mg, sodium 5 mg, and potassium 30 mg per teaspoon; provides dietary fiber 3 g and soluble fiber ~2 g per teaspoon; orange flavor]

3.4 g/teaspoon (283 g, 425 g, 660 g) [sugar free; contains potassium 30 mg, sodium 5 mg and phenylalanine 16 mg per teaspoon; provides dietary fiber 3 g and soluble fiber ~2 g per teaspoon; berry burst flavor]

Natural Fiber Therapy: 3.4 g/tablespoon (369 g, 539 g) [natural and orange flavors]

Natural Fiber Therapy Smooth Texture: 3.4 g/teaspoon (300 g) [sugar free; orange flavor]

Reguloid®:

3.4 g/teaspoon (284 g, 426 g) [sugar free; contains phenylalanine 30 mg and sodium 6 mg per teaspoon; provides dietary fiber 3 g and soluble fiber 3 g per teaspoon; orange flavor]

3.4 g/teaspoon (284 g, 426 g) [sugar free; contains phenylalanine 6 mg and sodium 2 mg per teaspoon; provides dietary fiber 3 g and soluble fiber 2 g per teaspoon; regular flavor]

3.4 g/tablespoon (369 g, 540 g) [contains sodium 9 mg per tablespoon; provides dietary fiber 3 g and soluble fiber 2 g per tablespoon; orange flavor]

3.4 g/tablespoon (369 g, 540 g) [contains sodium 4 mg per tablespoon; provides dietary fiber 2 g and soluble fiber 2 g per tablespoon; regular flavor]

Wafers:

Metamucil®: 3.4 g/2 wafers (24s) [contains soya lecithin, wheat, sodium 20 mg, and potassium 60 mg per 2 wafers; provides dietary fiber 6 g and soluble fiber 3 g per 2 wafers; apple and cinnamon spice flavors]

Generic AvailableYes: Excludes wafers

Mechanism of ActionPsyllium is a soluble fiber. It absorbs water in the intestine to form a viscous liquid which promotes peristalsis and reduces transit time.

Pharmacodynamics/Kinetics

Onset of action: Relief of constipation: 12-72 hours

Absorption: None; small amounts of grain extracts present in the preparation have been reportedly absorbed following colonic hydrolysis

Related Information

Index TermsAlinC 14

Regimen

Induction:

Prednisone: Oral: 40 mg/m^2/day (maximum 60 mg) days 0 to 28 (given in 3 divided doses)

[total dose/cycle = 1160 mg/m^2]

Vincristine: I.V.: 1.5 mg/m^2/day (maximum 2 mg) days 0, 7, 14, and 21

[total dose/cycle = 6 mg/m^2; maximum 8 mg]

Asparaginase: I.M.: 6000 units/m^2 3 times per week for 2 weeks

[total dose/cycle = 36,000 units/m^2]

Intrathecal therapy (triple): Days 0 and 22

Leucovorin: route and dose not specified: single dose 24 hours after every intrathecal treatment days 1 and 23

Administer one cycle only

CNS consolidation:

Mercaptopurine: Oral: 75 mg/m^2/day days 29 to 43

[total dose/cycle = 1125 mg/m^2]

Intrathecal therapy (triple): Days 29 and 36

Leucovorin: route and dose not specified: single dose 24 hours after every intrathecal treatment days 30 and 37

Administer one cycle only

Intensification:

Regimen A:

Methotrexate: I.V.: 1000 mg/m^2 continuous infusion over 24 hours day 1

[total dose/cycle = 1000 mg/m^2]

Cytarabine: I.V.: 1000 mg/m^2 continuous infusion over 24 hours day 1 (start 12 hours after start of methotrexate)

[total dose/cycle = 1000 mg/m^2]

Leucovorin: I.M., I.V., or Oral: 30 mg/m^2 at 24 and 36 hours after the start of methotrexate

[total dose/cycle = 60 mg/m^2]

followed by I.M., I.V., or Oral: 3 mg/m^2 at 48, 60, and 72 hours after the start of methotrexate

[total dose/cycle = 9 mg/m^2]

Repeat cycle every 3 weeks for 6 cycles (administered weeks 7, 10, 13, 16, 19, and 22)

Intrathecal therapy (triple): Weeks 9, 12, 15, and 18

Leucovorin: route and dose not specified: single dose 24 hours after every intrathecal treatment weeks 9, 12, 15, and 18

or

Regimen B:

Methotrexate: I.V.: 1000 mg/m^2 continuous infusion over 24 hours day 1

[total dose/cycle = 1000 mg/m^2]

Cytarabine: I.V.: 1000 mg/m^2 continuous infusion over 24 hours day 1 (start 12 hours after methotrexate)

[total dose/cycle = 1000 mg/m^2]

Leucovorin: I.M., I.V., or Oral: 30 mg/m^2 at 24 and 36 hours after the start of methotrexate

[total dose/cycle = 60 mg/m^2]

followed by I.M., I.V., or Oral: 3 mg/m^2 at 48, 60, and 72 hours after the start of methotrexate

[total dose/cycle = 9 mg/m^2]

Repeat cycle every 12 weeks for 6 cycles (administer weeks 7, 19, 31, 43, 55, and 67)

Intrathecal therapy (triple): Weeks 9, 12, 15, and 18

Leucovorin: route and dose not specified: single dose 24 hours after every intrathecal treatment weeks 9, 12, 15, and 18

Maintenance:

Regimen A:

Methotrexate: I.M.: 20 mg/m^2 weekly, weeks 25 to 156

[total dose/cycle = 2640 mg/m^2]

Mercaptopurine: Oral: 75 mg/m^2 daily, weeks 25 to 156

[total dose/cycle = 69,300 mg/m^2]

Intrathecal therapy (triple): Every 8 weeks, weeks 26 through 105

Leucovorin: route and dose not specified: single dose 24 hours after every intrathecal treatment weeks 26 through 105

Prednisone: Oral: 40 mg/m^2/day (maximum 60 mg) days 1 to 7 (given in 3 divided doses), weeks 8, 17, 25, 41, 57, 73, 89, and 105

[total dose/cycle = 2240 mg/m^2; maximum 3360 mg]

Vincristine: I.V.: 1.5 mg/m^2/day (maximum 2 mg) day 1, weeks 8, 9, 17, 18, 25, 26, 41, 42, 57, 58, 73, 74, 89, 90, 105, and 106

[total dose/cycle = 24 mg/m^2; maximum 32 mg]

or

Regimen B:

Methotrexate: I.M.: 20 mg/m^2 weekly, weeks 22-28, 34-40, 46-52, and 58-64

[total dose/cycle = 560 mg/m^2]

Mercaptopurine: Oral: 75 mg/m^2 daily for 7 weeks, weeks 22-28, 34-40, 46-52, and 58-64

[total dose/cycle = 14700 mg/m^2]

followed by

Methotrexate: I.M.: 20 mg/m^2 weekly, weeks 70 to 156

[total dose/cycle = 1720 mg/m^2]

Mercaptopurine: Oral: 75 mg/m^2 daily, weeks 70 to 156

[total dose/cycle = 45,150 mg/m^2]

Intrathecal therapy (triple): Every 8 weeks, weeks 26 through 105

Leucovorin: route and dose not specified: single dose 24 hours after every intrathecal treatment weeks 26 through 105

Prednisone: Oral: 40 mg/m^2/day (maximum 60 mg) days 1 to 7 (given in 3 divided doses), weeks 8, 17, 25, 41, 57, 73, 89, and 105

[total dose/cycle = 2240 mg/m^2]

Vincristine: I.V.: 1.5 mg/m^2/day (maximum 2 mg) day 1, weeks 8, 9, 17, 18, 25, 26, 41, 42, 57, 58, 73, 74, 89, 90, 105, and 106

[total dose/cycle = 24 mg/m^2; maximum 32 mg]

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Cisplatin: I.V.: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Vinblastine: I.V.: 0.2 mg/kg/day days 1 and 2

[total dose/cycle = 0.4 mg/kg]

Bleomycin: I.V.: 30 units/day days 2, 9, and 16

[total dose/cycle = 90 units]

Repeat cycle every 3 weeks

Variation 2:

Cisplatin: I.V.: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Vinblastine: I.V.: 0.15 mg/kg/day days 1 and 2

[total dose/cycle = 0.3 mg/kg]

Bleomycin: I.V.: 30 units/day days 2, 9, and 16

[total dose/cycle = 90 units]

Repeat cycle every 3 weeks

Variation 3:

Cisplatin: I.V.: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Vinblastine: I.V.: 6 mg/m^2/day days 1 and 2

[total dose/cycle = 12 mg/m^2]

Bleomycin: I.M.: 30 units/day days 2, 9, and 16

[total dose/cycle = 90 units]

Repeat cycle every 3 weeks

Pyrantel Pamoate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(pi RAN tel PAM oh ate)

U.S. Brand NamesPin-X® [OTC]; Reese's® Pinworm Medicine [OTC]

Canadian Brand NamesCombantrin™

Pharmacologic CategoryAnthelmintic

Use: Labeled IndicationsTreatment of pinworms (*Enterobius vermicularis*) and roundworms (*Ascaris lumbricoides*)

Use: Unlabeled/InvestigationalTreatment of whipworms (*Trichuris trichiura*) and hookworms (*Ancylostoma duodenale*)

Dosing: Adults**Note:** Dose is expressed as pyrantel base.

Roundworm, pinworm, or trichostrongyliasis: Oral: 11 mg/kg administered as a single dose; maximum dose: 1 g. (**Note:** For pinworm infection, dosage should be repeated in 2 weeks and all family members should be treated).

Hookworm (unlabeled use): Oral: 11 mg/kg administered once daily for 3 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

StorageProtect from light.

ContraindicationsHypersensitivity to pyrantel pamoate or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Anemia: Use with caution in patients with anemia.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Malnutrition: Use with caution in patients with malnutrition.

Special populations:

- Pregnancy: Use with caution in pregnancy.

Other warnings/precautions:

- Household contacts: Since pinworm infections are easily spread to others, treat all family members in close contact with the patient.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, drowsiness, insomnia, headache

Dermatologic: Rash

Gastrointestinal: Abdominal cramps, anorexia, diarrhea, nausea, vomiting, tenesmus

Hepatic: Liver enzymes increased

Neuromuscular & skeletal: Weakness

Drug Interactions

Aminoquinolines (Antimalarial): May decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

Monitoring ParametersStool for presence of eggs, worms, and occult blood, serum AST and ALT

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet, as pamoate:

Reese's® Pinworm Medicine: 180 mg [equivalent to pyrantel base 62.5 mg/tablet]

Suspension, oral as pamoate:

Pin-X®: 144 mg/mL (30 mL, 60 mL) [equivalent to pyrantel base 50 mg/mL; sugar free; contains sodium benzoate; caramel flavor]

Reese's® Pinworm Medicine: 144 mg/mL (30 mL) [equivalent to pyrantel base 50 mg/mL]

Tablet, chewable, as pamoate:

Pin-X®: 720.5 mg [equivalent to pyrantel base 250 mg/tablet; contains aspartame; orange flavor]

Generic AvailableNo

Mechanism of ActionCauses the release of acetylcholine and inhibits cholinesterase; acts as a depolarizing neuromuscular blocker, paralyzing the helminths

Pharmacodynamics/Kinetics

Absorption: Oral: Poor

Metabolism: Partially hepatic

Time to peak, serum: 1-3 hours

Excretion: Feces (50% as unchanged drug); urine (7% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, or insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Pyrazinamide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(peer a ZIN a mide)
Canadian Brand NamesTebrazid™
Pharmacologic CategoryAntitubercular Agent
Use: Labeled IndicationsAdjunctive treatment of tuberculosis in combination with other antituberculosis agents
Dosing: Adults

Tuberculosis treatment: Oral (dosing is based on lean body weight):

Daily therapy: 15-30 mg/kg/day

40-55 kg: 1000 mg

56-75 kg: 1500 mg

76-90 kg: 2000 mg (maximum dose regardless of weight)

Twice weekly directly observed therapy (DOT): 50 mg/kg

40-55 kg: 2000 mg

56-75 kg: 3000 mg

76-90 kg: 4000 mg (maximum dose regardless of weight)

Three times/week DOT: 25-30 mg/kg (maximum: 2.5 g)

40-55 kg: 1500 mg

56-75 kg: 2500 mg

76-90 kg: 3000 mg (maximum dose regardless of weight)

Note: Used as part of a multidrug regimen. Treatment regimens consist of an initial 2-month phase, followed by a continuation phase of 4 or 7 additional months; frequency of dosing may differ depending on phase of therapy.

Dosing: ElderlyStart with a lower daily dose (15 mg/kg) and increase as tolerated.
Dosing: Pediatric

Tuberculosis treatment: Oral:

Daily therapy: 15-30 mg/kg/day (maximum: 2 g/day)

Twice weekly directly observed therapy (DOT): 50 mg/kg/dose (maximum: 4 g/dose)

See “Note” in adult dosing.

Dosing: Renal Impairment

Cl_{cr} <50 mL/minute: Avoid use or reduce dose to 12-20 mg/kg/day.

Avoid use in hemo- and peritoneal dialysis as well as continuous arteriovenous or venovenous hemofiltration.

Dosing: Hepatic ImpairmentReduce dose.
Calculations

- Adjusted Body Weight
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Ideal Body Weight: Adults

Extemporaneously PreparedPyrazinamide suspension can be compounded with simple syrup or 0.5% methylcellulose with simple syrup at a concentration of 100 mg/mL; the suspension is stable for 2 months at 4°C or 25°C when stored in glass or plastic bottles

To prepare pyrazinamide suspension in 0.5% methylcellulose with simple syrup: Crush 200 pyrazinamide 500 mg tablets and mix with a suspension containing 500 mL of 1% methylcellulose and 500 mL simple syrup. Add to this a suspension containing 140 crushed pyrazinamide tablets in 350 mL of 1% methylcellulose and 350 mL of simple syrup to make 1.7 L of suspension containing pyrazinamide 100 mg/mL in 0.5% methylcellulose with simple syrup.

Nahata MC, Morosco RS, and Peritre SP, "Stability of Pyrazinamide in Two Suspensions," *Am J Health Syst Pharm*, 1995, 52:1558-60.

ContraindicationsHypersensitivity to pyrazinamide or any component of the formulation; acute gout; severe hepatic damage
Warnings/Precautions

Concerns related to adverse effects:

- Hepatotoxicity: Dose-related hepatotoxicity ranging from transient ALT/AST elevations to jaundice, hepatitis and/or liver atrophy (rare) has occurred.

Disease-related concerns:

- Alcoholism: Due to concerns for pre-existing hepatic dysfunction, use with caution in patients with a history of alcoholism (even if ethanol consumption is discontinued during therapy).

- Diabetes: Use with caution in patients with diabetes mellitus.

- Gout: May inhibit uric acid excretion; acute gouty attacks have been reported. Use with caution in patients with chronic gout; contraindicated with acute gout.

- Porphyria: Use with caution in patients with porphyria.

- Renal impairment: Use with caution in patients with renal failure.

Concurrent drug therapy issues:

- Hepatotoxic agents: Use with caution in patients receiving concurrent medications associated with hepatotoxicity (particularly with rifampin).

Geriatric ConsiderationsPyrazinamide is used in the 2-month intensive treatment phase of a 6-month treatment plan. Most elderly acquired their *Mycobacterium tuberculosis* infection before effective chemotherapy was available; however, older persons with new infections (not reactivation), or who are from areas where drug-resistant *M. tuberculosis* is endemic, or who are HIV-infected should receive 3-4 drug therapies including pyrazinamide.
Pregnancy Risk FactorC
LactationEnters breast milk/use caution
Adverse Reactions

1% to 10%:

Central nervous system: Malaise

Gastrointestinal: Anorexia, nausea, vomiting

Neuromuscular & skeletal: Arthralgia, myalgia

<1%: Acne, angioedema (rare), anticoagulant effect, dysuria, fever, gout, hepatotoxicity, interstitial nephritis, itching, photosensitivity, porphyria, rash, sideroblastic anemia, thrombocytopenia, urticaria

Drug Interactions

CycloSPORINE: Pyrazinamide may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Rifampin: Pyrazinamide may enhance the hepatotoxic effect of Rifampin. Severe (even fatal) liver injury has been reported in patients receiving these 2 drugs as a 2-month treatment regimen for latent TB infection. *Risk D: Consider therapy modification*

Test InteractionsReacts with Acetest® and Ketostix® to produce pinkish-brown color
Monitoring ParametersPeriodic liver function tests, serum uric acid, sputum culture, chest x-ray 2-3 months into treatment and at completion
Nursing: Physical Assessment/MonitoringAssess patient history for use cautions and evaluate any history of alcohol intake prior to beginning treatment. Administer with at least one other effective agent for tuberculosis (other than rifampin). Assess for potential interactions with pharmacological or herbal products patient is taking (especially anything associated with hepatotoxicity). Evaluate results of laboratory tests and chest x-ray regularly, therapeutic effectiveness, and adverse reactions. Teach patient proper use and necessity of scheduled laboratory tests, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsPeriodic liver function, serum uric acid, sputum culture, chest x-ray 2-3 months into treatment and at completion
Patient EducationTake as directed, with food. It is imperative to take for full length of therapy; do not miss doses and do not discontinue without consulting prescriber. You will need regular medical follow-up and laboratory tests while taking this medication. May cause nausea or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report change in color of urine, pale stools, easy bruising or bleeding, blood in urine or difficulty urinating, yellowing of skin or eyes, extreme joint pain, unusual fever, or unresolved nausea or vomiting, **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 500 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Pyrazinamide)

500 mg (30): $35.03

Mechanism of ActionConverted to pyrazinoic acid in susceptible strains of *Mycobacterium* which lowers the pH of the environment; exact mechanism of action has not been elucidated

Pharmacodynamics/KineticsBacteriostatic or bactericidal depending on drug's concentration at infection site

Absorption: Well absorbed

Distribution: Widely into body tissues and fluids including liver, lung, and CSF

Relative diffusion from blood into CSF: Adequate with or without inflammation (exceeds usual MICs)

CSF:blood level ratio: Inflamed meninges: 100%

Protein binding: 50%

Metabolism: Hepatic

Half-life elimination: 9-10 hours

Time to peak, serum: Within 2 hours

Excretion: Urine (4% as unchanged drug)

Pyrethrins and Piperonyl Butoxide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(pye RE thrins & pi PER oh nil byo TOKS ide)

U.S. Brand NamesA-200® Lice Treatment Kit [OTC]; A-200® Maximum Strength [OTC]; Licide® [OTC]; Pronto® Complete Lice Removal System [OTC]; Pronto® Plus Hair and Scalp Masque [OTC] [DSC]; Pronto® Plus Lice Killing Mousse Plus Vitamin E [OTC]; Pronto® Plus Lice Killing Mousse Shampoo Plus Natural Extracts and Oils [OTC]; Pronto® Plus Warm Oil Treatment and Conditioner [OTC]; RID® Maximum Strength [OTC]; Tisit® Blue Gel [OTC]; Tisit® [OTC]

Canadian Brand NamesPronto® Lice Control; R & C™ II; R & C™ Shampoo/Conditioner; RID® Mousse

Pharmacologic CategoryAntiparasitic Agent, Topical; Pediculocide; Shampoo, Pediculocide

Use: Labeled IndicationsTreatment of *Pediculus humanus* infestations (head lice, body lice, pubic lice, and their eggs)

Dosing: Adults**Treatment of *Pediculus humanus* infestations:**

Topical products:

Apply enough solution to completely wet infested area, including hair

Allow to remain on area for 10 minutes

Wash and rinse with large amounts of warm water

Use fine-toothed comb to remove lice and eggs from hair

Shampoo hair to restore body and luster

Treatment may be repeated if necessary once in a 24-hour period

Repeat treatment in 7-10 days to kill newly hatched lice

Note: Keep out of eyes when rinsing hair; protect eyes with a wash cloth or towel.

Solution for furniture, bedding: Spray on entire area to be treated; allow to dry before use. Intended for use on items which cannot be laundered or dry cleaned. **Not for use on humans or animals.**

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Head lice, body lice:** Children: Refer to adult dosing.

Administration: TopicalFor external use only. Avoid touching eyes, mouth, or other mucous membranes.

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F). Do not puncture or incinerate mousse container.

ContraindicationsHypersensitivity to pyrethrins, ragweed, chrysanthemums, or any component of the formulation

Warnings/Precautions

Other warnings/precautions:

- Appropriate use: For external use only; do not use near the eye, in eyelashes or eyebrows. Avoid contact with mucosal tissues (nasal, oral, or genital).

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Dermatologic: Pruritus

Local: Burning, stinging, irritation with repeat use

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, topical:

Pronto® Plus Hair and Scalp Masque: Pyrethrins 0.33% and piperonyl butoxide 4% (60 g) [green cream shampoo; contains coconut and sesame oil; apple herb scent; packaged with nit removal comb] [DSC]

Foam, topical [mousse]:

RID® Maximum Strength: Pyrethrins 0.33% and piperonyl butoxide 4% (156 g) [packaged with nit removal comb] [DSC]

Gel, topical:

Tisit® Blue Gel: Pyrethrins 0.33% and piperonyl butoxide 3% (30 g)

Kit:

- A-200® Lice Treatment Kit:
    - Shampoo: Pyrethrins 0.33% and piperonyl butoxide 4% (120 mL)
    - Solution [spray; for bedding; not for human or animal use]: Permethrin 0.5% (180 mL)
    - [packaged with nit removal comb]
- Pronto® Complete Lice Removal System:
    - Shampoo: Pyrethrins 0.33% and piperonyl butoxide 4% (60 mL)
    - Solution, topical: Benzalkonium chloride 0.1% (60 mL) [lice egg remover antiseptic]
    - [packaged with household furniture spray and nit removal comb]

Liquid, topical:

- Tisit®: Pyrethrins 0.33% and piperonyl butoxide 2% (60 mL, 120 mL) [packaged with nit removal comb]

Oil, topical:

- Pronto® Plus Warm Oil Treatment and Conditioner: Pyrethrins 0.33% and piperonyl butoxide 4% (36 mL) [fruity herbal scent; packaged with nit removal comb]

Shampoo: Pyrethrins 0.33% and piperonyl butoxide 4% (60 mL, 120 mL)

- A-200® Maximum Strength: Pyrethrins 0.33% and piperonyl butoxide 4% (60 mL, 120 mL) [contains benzyl alcohol; packaged with nit removal comb]
- Licide®: Pyrethrins 0.33% and piperonyl butoxide 4% (120 mL) [packaged with nit removal comb; also available in a kit containing shampoo, household spray, and nit removal comb]
- Pronto® Plus Lice Killing Mousse Shampoo Plus Natural Extracts and Oils: Pyrethrins 0.33% and piperonyl butoxide 4% (60 mL) [packaged with nit removal comb]
- Pronto® Plus Lice Killing Mousse Shampoo Plus Vitamin E: Pyrethrins 0.33% and piperonyl butoxide 4% (120 mL) [blue mousse shampoo; contains vitamin E; packaged with nit removal comb]
- RID® Maximum Strength: Pyrethrins 0.33% and piperonyl butoxide 4% (60 mL, 120 mL, 180 mL, 240 mL) [packaged with nit removal comb; also available in a kit containing shampoo, gel, and furniture spray]
- Tisit®: Pyrethrins 0.33% and piperonyl butoxide 3% (60 mL, 120 mL) [also available in a kit containing shampoo, nit removal comb, and furniture spray]

Solution [spray; for furniture, garments, bedding; not for human or animal use]:

- Tisit®: Pyrethrins 0.4% and piperonyl butoxide 2% (150 mL)

Generic Available Yes: Shampoo

Mechanism of Action Pyrethrins are derived from flowers that belong to the chrysanthemum family. The mechanism of action on the neuronal membranes of lice is similar to that of DDT. Piperonyl butoxide is usually added to pyrethrin to enhance the product's activity by decreasing the metabolism of pyrethrins in arthropods.

Pharmacodynamics/Kinetics

Onset of action: ~30 minutes

Absorption: Minimal

Metabolism: Via ester hydrolysis and hydroxylation

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms Piperonyl Butoxide and Pyrethrins

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Pyridostigmine may be confused with physostigmine

Mestinon® may be confused with Metatensin®

Regonol® may be confused with Reglan®, Renagel®

Pronunciation(peer id oh STIG meen)

U.S. Brand NamesMestinon®; Mestinon® Timespan®; Regonol®

Canadian Brand NamesMestinon®; Mestinon®-SR

Pharmacologic CategoryAcetylcholinesterase Inhibitor

Use: Labeled IndicationsSymptomatic treatment of myasthenia gravis; antidote for nondepolarizing neuromuscular blockers

Military use: Pretreatment for Soman nerve gas exposure

Dosing: Adults

Myasthenia gravis:

Oral: Highly individualized dosing ranges: 60-1500 mg/day, usually 600 mg/day divided into 5-6 doses, spaced to provide maximum relief

Sustained release formulation: Highly individualized dosing ranges: 180-540 mg once or twice daily (doses separated by at least 6 hours); **Note:** Most clinicians reserve sustained release dosage form for bedtime dose only.

I.M. or slow I.V. Push: To supplement oral dosage pre- and postoperatively during labor and postpartum, during myasthenic crisis, or when oral therapy is impractical): ~1/30th of oral dose; observe patient closely for cholinergic reactions

I.V. infusion: To supplement oral dosage pre- and postoperatively, during labor and postpartum, during myasthenic crisis, or when oral therapy is impractical): Initial: 2 mg/hour with gradual titration in increments of 0.5-1 mg/hour, up to a maximum rate of 4 mg/hour

Pretreatment for Soman nerve gas exposure (military use): Oral: 30 mg every 8 hours beginning several hours prior to exposure; discontinue at first sign of nerve agent exposure, then begin atropine and pralidoxime

Reversal of nondepolarizing muscle relaxants: I.V.: 0.1-0.25 mg/kg/dose; 10-20 mg is usually sufficient (full recovery usually occurs ≤15 minutes, but ≥30 minutes may be required).

Note: Atropine sulfate (0.6-1.2 mg) I.V. immediately prior to pyridostigmine to minimize side effects

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Myasthenia gravis:

Oral: Children: 7 mg/kg/24 hours divided into 5-6 doses. Most clinicians reserve sustained release dosage form for bedtime dose only.

I.M., slow I.V. push: Children: 0.05-0.15 mg/kg/dose

Reversal of nondepolarizing muscle relaxants: I.V.: Children: Dosing range: 0.1-0.25 mg/kg/dose (full recovery usually occurs ≤15 minutes, but ≥30 minutes may be required).

Note: Atropine sulfate (0.6-1.2 mg) I.V. immediately prior to pyridostigmine to minimize side effects:

Dosing: Renal ImpairmentLower dosages may be required due to prolonged elimination; no specific recommendations have been published.

Administration: I.V. DetailpH: 5

Administration: OralDo **not** crush sustained release tablet.

Storage

Injection: Protect from light.

Tablet:

30 mg: Store under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light. Stable at room temperature for up to 3 months.

Mestinon®: Store at 25°C (77°F). Protect from moisture.

Compatibility

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Compatibility in syringe: Compatible: Glycopyrrolate.

ContraindicationsHypersensitivity to pyridostigmine, bromides, or any component of the formulation; GI or GU obstruction
Allergy Considerations

- Cholinesterase Inhibitor Allergy

Warnings/Precautions

Boxed warnings:

- Regonol® injection: See "Dosage form specific issues" below.

Concerns related to adverse effects:

- Anticholinesterase insensitivity: For brief or prolonged periods, anticholinesterase insensitivity can develop.
- Cholinergic effects: Discontinue if symptoms of excess cholinergic activity (eg, salivation, sweating, urinary incontinence); overdosage may result in cholinergic crisis, which must be distinguished from myasthenic crisis.
- Hypersensitivity reactions: Have atropine and epinephrine ready to treat hypersensitivity reactions.

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Cardiovascular disease: Use with caution in patients with bradycardia or cardiac arrhythmias.
- GI disease: Use with caution in patients with GI disease, including peptic ulcer disease.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Myasthenia gravis: Adequate facilities should be available for cardiopulmonary resuscitation when testing and adjusting dose for myasthenia gravis.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Dosage form specific issues:

- Regonol® injection: Contains 1% benzyl alcohol as the preservative; not intended for use in newborns. **[U.S. Boxed Warning]: Must be administered by trained personnel.**

Geriatric ConsiderationsMany elderly may have pulmonary or cardiovascular diseases which will require cautious use of pyridostigmine.
Pregnancy Risk FactorB
Pregnancy ConsiderationsSafety has not been established for use during pregnancy. The potential benefit to the mother should outweigh the potential risk to the fetus. When pyridostigmine is needed in myasthenic mothers, giving dose parenterally 1 hour before completion of the second stage of labor may facilitate delivery and protect the neonate during the immediate postnatal state.
LactationEnters breast milk/compatible
Breast-Feeding ConsiderationsNeonates of myasthenia gravis mothers may have difficulty in sucking and swallowing (as well as breathing). Neonatal pyridostigmine may be indicated by symptoms (confirmed by edrophonium test).
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias (especially bradycardia), AV block, cardiac arrest, decreased carbon monoxide, flushing, hypotension, nodal rhythm, nonspecific ECG changes, syncope, tachycardia

Central nervous system: Convulsions, dizziness, drowsiness, dysphonia, headache, loss of consciousness

Dermatologic: Skin rash, thrombophlebitis (I.V.), urticaria

Gastrointestinal: Abdominal pain, diarrhea, dysphagia, flatulence, hyperperistalsis, nausea, salivation, stomach cramps, vomiting

Genitourinary: Urinary urgency

Neuromuscular & skeletal: Arthralgia, dysarthria, fasciculations, muscle cramps, myalgia, spasms, weakness

Ocular: Amblyopia, lacrimation, small pupils

Respiratory: Bronchial secretions increased, bronchiolar constriction, bronchospasm, dyspnea, laryngospasm, respiratory arrest, respiratory depression, respiratory muscle paralysis

Miscellaneous: Allergic reactions, anaphylaxis, diaphoresis increased

Drug Interactions

Beta-Blockers: Acetylcholinesterase Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Cholinergic Agonists: Acetylcholinesterase Inhibitors may enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Ginkgo Biloba: May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. *Risk C: Monitor therapy*

Methocarbamol: May diminish the therapeutic effect of Pyridostigmine. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): Acetylcholinesterase Inhibitors may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Succinylcholine: Acetylcholinesterase Inhibitors may enhance the neuromuscular-blocking effect of Succinylcholine. *Risk C: Monitor therapy*

Test InteractionsIncreased aminotransferase [ALT/AST] (S), increased amylase (S)

Monitoring ParametersObserve for cholinergic reactions, particularly when administered I.V.

Nursing: Physical Assessment/MonitoringWhen used to reverse neuromuscular block (anesthesia or excessive acetylcholine), monitor patient safety until full return of neuromuscular functioning. Assess bladder and sphincter adequacy prior to administering medication. Monitor therapeutic effectiveness and adverse reactions (eg, cholinergic crisis). Assess knowledge/teach patient appropriate use (self-injections, oral), interventions to reduce side effects, and adverse symptoms to report.

Patient EducationThis drug will not cure myasthenia gravis, but may help reduce symptoms. Use as directed; do not increase dose or discontinue without consulting prescriber. Take extended release tablets at bedtime; do not chew or crush extended release tablets. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, drowsiness, or hypotension (rise slowly from sitting or lying position and use caution when driving or climbing stairs); vomiting or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). Report persistent abdominal discomfort; significantly increased salivation, sweating, tearing, or urination; flushed skin; chest pain or palpitations; acute headache; unresolved diarrhea; excessive fatigue, insomnia, dizziness, or depression; increased muscle, joint, or body pain; vision changes or blurred vision; or shortness of breath or wheezing.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as bromide:

Regonol®: 5 mg/mL (2 mL) [contains benzyl alcohol]

Syrup, as bromide:

Mestinon®: 60 mg/5 mL (480 mL) [raspberry flavor; contains alcohol 5%, sodium benzoate]

Tablet, as bromide: 60 mg

Mestinon®: 60 mg

Tablet, sustained release, as bromide:

Mestinon® Timespan®: 180 mg

Generic AvailableYes: Tablet

ManufacturerICN Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Syrup (Mestinon)

60 mg/5 mL (240): $59.98

Tablet, controlled release (Mestinon)

180 mg (30): $70.37

Tablets (Mestinon)

60 mg (30): $49.19

Tablets (Pyridostigmine Bromide)

60 mg (30): $17.99

Mechanism of ActionInhibits destruction of acetylcholine by acetylcholinesterase which facilitates transmission of impulses across myoneural junction

Pharmacodynamics/Kinetics

Onset of action: Oral, I.M.: 15-30 minutes; I.V. injection: 2-5 minutes

Duration: Oral: Up to 6-8 hours (due to slow absorption); I.V.: 2-3 hours

Absorption: Oral: Very poor

Distribution: 19 ± 12 L

Metabolism: Hepatic

Bioavailability: 10% to 20%

Half-life elimination: 1-2 hours; Renal failure: ≤6 hours

Excretion: Urine (80% to 90% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dysphagia.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay rarely cause dysphoria or drowsiness
Mental Health: Effects on Psychiatric TreatmentNone reported; but mouth watering is common and may be additive to the sialorrhea associated with clozapine therapy
Anesthesia and Critical Care Concerns/Other ConsiderationsAtropine or glycopyrrolate must be administered in combination with pyridostigmine. Large parenteral doses should be accompanied by parenteral atropine. Ephedrine sulfate and potassium chloride have been used orally (in adult patients) to improve response. Extended release products are preferred for use **only** at bedtime for patients who are very weak upon arising.

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Pyridoxine may be confused with paroxetine, pralidoxime, Pyridium®

Pronunciation(peer i DOKS een)

U.S. Brand NamesAminoxin [OTC]; Pyri-500 [OTC]

Pharmacologic Category[Vitamin, Water Soluble]

Use: Labeled IndicationsPrevention and treatment of vitamin B_6 deficiency, pyridoxine-dependent seizures in infants

Use: Unlabeled/InvestigationalTreatment and prophylaxis of neurological toxicities (ie, seizures, coma) associated with isoniazid, hydrazine, and Gyromitrin-containing mushroom (false morel) overdose/toxicity

Dosing: Adults

Recommended daily allowance (RDA):

Male: 1.7-2.0 mg

Female: 1.4-1.6 mg

Dietary deficiency: Oral: 10-20 mg/day for 3 weeks

Drug-induced neuritis (eg, isoniazid, hydralazine, penicillamine, cycloserine): Oral:

Treatment: 100-200 mg/24 hours

Prophylaxis: 25-100 mg/24 hours

Treatment of seizures and/or coma from acute isoniazid toxicity (unlabeled use): I.V.:

Acute ingestion of known amount: A total dose of pyridoxine equal to the amount of isoniazid ingested should be given (ie, if 9 g of isoniazid were ingested, give a total dose of 9 g pyridoxine). Administer at a rate of 1 g/minute if actively seizing; administer over 30 minutes if not actively seizing.

Acute ingestion of unknown amount: 5 g given at a rate of 1 g/minute; repeat doses (every 5-10 minutes) may be needed for persistent seizure activity or CNS toxicity

Treatment of acute hydrazine toxicity (unlabeled use; Nagappan, 2000): I.V.: A total dose of 25 mg/kg should be given over 15-30 minutes

Treatment of seizures from acute Gyromitrin-containing mushroom toxicity (unlabeled use; Diaz, 2005): I.V.: 25 mg/kg over 15-30 minutes; repeat dose as needed to control seizures

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Recommended daily allowance (RDA):

1-3 years: 0.9 mg

4-6 years: 1.3 mg

7-10 years: 1.6 mg

Pyridoxine-dependent Infants:

Oral: 2-100 mg/day

I.M., I.V., SubQ: 10-100 mg

Dietary deficiency: Oral: Children: 5-25 mg/24 hours for 3 weeks, then 1.5-2.5 mg/day in multiple vitamin product

Drug-induced neuritis (eg, isoniazid, hydralazine, penicillamine, cycloserine): Oral: Children:

Treatment: 10-50 mg/24 hours

Prophylaxis: 1-2 mg/kg/24 hours

Treatment of seizures and/or coma from acute isoniazid toxicity (unlabeled use): I.V.: Children:

Acute ingestion of known amount: A total dose of pyridoxine equal to the amount of isoniazid ingested should be given (ie, if 9 g of isoniazid were ingested, give a total dose of 9 g pyridoxine). Administer at a rate of 1 g/minute if actively seizing; administer over 30 minutes if not actively seizing.

Acute ingestion of unknown amount: 5 g given at a rate of 1 g/minute; repeat doses (every 5-10 minutes) may be needed for persistent seizure activity or CNS toxicity

Treatment of seizures from acute Gyromitrin-containing mushroom toxicity (unlabeled use; Diaz, 2005): I.V.: Children: 25 mg/kg over 15-30 minutes; repeat dose as needed to control seizures

Administration: I.M.Burning may occur at the injection site after I.M. or SubQ administration.
Administration: I.V.Seizures have occurred following I.V. administration of very large doses. In patients with active seizures, administer dose at a rate of 1 g/minute; for patients without active seizures, administer dose over 15-30 minutes. If the parenteral formulation is not available, anecdotal reports suggest that pyridoxine tablets may be crushed and made into a slurry and given at the same dose. However, oral administration is not recommended for acutely poisoned patients with seizure activity.
Administration: I.V. DetailpH: 2.0-3.8
StorageProtect from light.
CompatibilityStable in fat emulsion 10%.

Compatibility in syringe: Compatible: Doxapram.

ExtemporaneouslyPreparedA 1 mg/mL oral solution was stable for 30 days when refrigerated when compounded as follows:

Withdraw 100 mg (1 mL of a 100 mg/mL injection) from a vial with a needle and syringe, add to 99 mL of simple syrup in an amber bottle

Keep in refrigerator

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 3rd ed, Cincinnati, OH: Harvey Whitney Books Co, 1997.

ContraindicationsHypersensitivity to pyridoxine or any component of the formulation
Warnings/Precautions

Warnings related to adverse effects:

- Neuropathy: Severe, permanent peripheral neuropathies have been reported; neurotoxicity is more common with long-term administration of large doses (>2 g/day).

Dosage form specific issues:

- Aluminum: Some parenteral products contain aluminum; use caution in patients with impaired renal function and neonates.

Other warnings/precautions:

- Adequate supplies: High doses may be required to reverse neurological toxicity secondary to isoniazid toxicity. Emergency departments should ensure an adequate supply in the event of an acute isoniazid overdose.

- Dependence/withdrawal: Doses >200 mg/day may cause dependence and withdrawal.

- Vitamin deficiency: Single vitamin deficiency is rare; evaluate for other deficiencies.

Geriatric ConsiderationsUse with caution in patients with Parkinson's disease treated with levodopa.
Pregnancy Risk FactorA/C (dose exceeding RDA recommendation)
Pregnancy ConsiderationsCrosses the placenta; available evidence suggests safe use during pregnancy
LactationEnters breast milk/compatible
Breast-Feeding ConsiderationsCrosses into breast milk; possible inhibition of lactation at doses >600 mg/day. AAP considers **compatible** with breast-feeding.
Adverse ReactionsFrequency not defined.

Central nervous system: Headache, seizure (following very large I.V. doses)

Endocrine & metabolic: Acidosis

Gastrointestinal: Nausea

Hepatic: Increased AST

Neuromuscular & skeletal: Neuropathy, paresthesia

Miscellaneous: Allergic reactions

Drug Interactions

Altretamine: Pyridoxine may diminish the therapeutic effect of Altretamine. Specifically when altretamine is used in combination with Cisplatin the response duration may be diminished. *Risk D: Consider therapy modification*

Barbiturates: Pyridoxine may increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

Levodopa: Pyridoxine may diminish the therapeutic effect of Levodopa. *Risk D: Consider therapy modification*

Phenytoin: Pyridoxine may increase the metabolism of Phenytoin. This is most apparent in high pyridoxine doses (eg, 80 mg to 200 mg daily)

Risk C: Monitor therapy

Test InteractionsUrobilinogen

Monitoring ParametersFor treatment of isoniazid, hydrazine, or Gyromitrin-containing mushroom toxicity, anion gap, arterial blood gases, electrolytes, neurological exam, seizure activity

Reference RangeOver 50 ng/mL (SI: 243 nmol/L) (varies considerably with method). A broad range is ~25-80 ng/mL (SI: 122-389 nmol/L). HPLC method for pyridoxal phosphate has normal range of 3.5-18 ng/mL (SI: 17-88 nmol/L).

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse effects at beginning of therapy and regularly with long-term use. Assess knowledge/teach patient appropriate use, dietary instructions, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed. Do not take more than recommended. Do not exceed recommended intake of dietary B_6 (eg, red meat, bananas, potatoes, yeast, lima beans, and whole grain cereals). You may experience burning or pain at injection site; notify prescriber if this persists. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 50 mg, 250 mg

Aminoxin: 20 mg

Injection, solution, as hydrochloride: 100 mg/mL (1 mL)

Liquid, oral, as hydrochloride: 200 mg/5 mL (120 mL)

Tablet, as hydrochloride: 25 mg, 50 mg, 100 mg, 250 mg, 500 mg

Tablet, sustained release, as hydrochloride:

Pyri-500: 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Pyridoxine HCl)

100 mg/mL (25): $279.99

Tablets (Vitamin B-6)

100 mg (100): $13.99

Mechanism of ActionPrecursor to pyridoxal, which functions in the metabolism of proteins, carbohydrates, and fats; pyridoxal also aids in the release of liver and muscle-stored glycogen and in the synthesis of GABA (within the central nervous system) and heme

Pharmacodynamics/Kinetics

Absorption: Enteral, parenteral: Well absorbed

Metabolism: Via 4-pyridoxic acid (active form) and other metabolites

Half-life elimination: 15-20 days

Excretion: Urine

Related Information

- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay decrease the effects of levodopa and phenobarbital

Cardiovascular ConsiderationsEpidemiological evidence suggests that total plasma homocysteine level may be an independent cardiovascular risk factor. Plasma homocysteine levels are strongly influenced by genetics and diet (folic acid, pyridoxine/vitamin B_6, and cyanocobalamine/vitamin B_{12}). These vitamins help to break down homocysteine in the body.

Schnyder, et al, studied the effects of homocysteine-lowering therapy (folic acid 1 mg/day, vitamin B_6 10 mg/day, vitamin B_{12} 0.4 mg/day) in patients with coronary artery disease after successful angioplasty in the Swiss Heart Study. This randomized, double-blind, placebo-controlled trial looked at a composite endpoint (death, nonfatal MI, repeat revascularization) 6 months and 1 year after angioplasty. Homocysteine-lowering therapy significantly decreased the incidence of major adverse events, primarily due to a reduced rate of target lesion revascularization. Investigators in the Folate After Coronary Intervention Trial randomized patients who underwent successful coronary stenting procedures to placebo or folic acid (1.2 mg/day), vitamin B_6 (4.8 mg/day), and vitamin B_{12} (0.06 mg/day). Vitamin supplementation was associated with increased restenosis in these PCI patients.

Index TermsPyridoxine Hydrochloride; Vitamin B_6

Medication Safety Issues

Sound-alike/look-alike issues:

Daraprim® may be confused with Dantrium®, Daranide®

Pronunciation(peer i METH a meen)
U.S. Brand NamesDaraprim®
Canadian Brand NamesDaraprim®
Pharmacologic CategoryAntimalarial Agent
Use: Labeled IndicationsProphylaxis of malaria due to susceptible strains of plasmodia; used in conjunction with quinine and sulfadiazine for the treatment of uncomplicated attacks of chloroquine-resistant *P. falciparum* malaria; used in conjunction with fast-acting schizonticide to initiate transmission control and suppression cure; synergistic combination with sulfonamide in treatment of toxoplasmosis
Dosing: Adults

Malaria chemoprophylaxis (for areas of chloroquine-resistant*P. falciparum*): Oral: Begin prophylaxis 2 weeks before entering endemic area: 25 mg once weekly. Dosage should be continued for all age groups for at least 6-10 weeks after leaving endemic areas

Chloroquine-resistant*P. falciparum*malaria (when used in conjunction with quinine and sulfadiazine): Oral: 25 mg twice daily for 3 days

Toxoplasmosis: Oral: 50-75 mg/day together with 1-4 g of a sulfonamide for 1-3 weeks depending on patient's tolerance and response, then reduce dose by 50% and continue for 4-5 weeks **or** 25-50 mg/day for 3-4 weeks

Prophylaxis for first episode of*Toxoplasma gondii*: Oral: 50 mg once weekly with dapsone, plus oral folinic acid 25 mg once weekly

Prophylaxis to prevent recurrence of*Toxoplasma gondii*: Oral: 25-50 mg once daily in combination with sulfadiazine or clindamycin, plus oral folinic acid 10-25 mg daily. Atovaquone plus oral folinic acid 10 mg daily has also been used in combination with pyrimethamine.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Malaria chemoprophylaxis (for areas with chloroquine-resistant*P. falciparum*): Oral: Begin prophylaxis 2 weeks before entering endemic area:

Children: 0.5 mg/kg once weekly, not to exceed 25 mg/dose

or

<4 years: 6.25 mg once weekly

4-10 years: 12.5 mg once weekly

Children >10 years: Refer to adult dosing

Note: Dosage should be continued for all age groups for at least 6-10 weeks after leaving endemic areas.

Chloroquine-resistant*P. falciparum*malaria (when used in conjunction with quinine and sulfadiazine): Oral:

Children:

<10 kg: 6.25 mg/day once daily for 3 days

10-20 kg: 12.5 mg/day once daily for 3 days

20-40 kg: 25 mg/day once daily for 3 days

Toxoplasmosis:

Infants (congenital toxoplasmosis): Oral: 1 mg/kg once daily for 6 months with sulfadiazine then every other month with sulfa, alternating with spiramycin.

Children: Loading dose: 2 mg/kg/day divided into 2 equal daily doses for 1-3 days (maximum: 100 mg/day) followed by 1 mg/kg/day divided into 2 doses for 4 weeks; maximum: 25 mg/day

With sulfadiazine or trisulfapyrimidines: 2 mg/kg/day divided every 12 hours for 3 days, followed by 1 mg/kg/day once daily or divided twice daily for 4 weeks given with trisulfapyrimidines or sulfadiazine

Prophylaxis for first episode of*Toxoplasma gondii*: Oral:

Children ≥1 month of age: 1 mg/kg/day once daily with dapsone, plus oral folinic acid 5 mg every 3 days

Adolescents: Refer to adult dosing.

Prophylaxis to prevent recurrence of *Toxoplasma gondii*: Oral:

Children ≥1 month of age: 1 mg/kg/day once daily given with sulfadiazine or clindamycin, plus oral folinic acid 5 mg every 3 days

Adolescents: Refer to adult dosing.

Administration: OralAdminister with meals to minimize GI distress.
StorageStore at 15°C to 25°C (59°F to 77°F). Protect from light.
Extemporaneously PreparedPyrimethamine tablets may be crushed to prepare oral suspensions of the drug in water, cherry syrup or sucrose-containing solutions at a concentration of 1 mg/mL; stable at room temperature for 5-7 days

AHFS Drug Information, McEvoy G, ed, Bethesda, MD: American Society of Health-System Pharmacists, 1996.

ContraindicationsHypersensitivity to pyrimethamine or any component of the formulation; chloroguanide; resistant malaria; megaloblastic anemia secondary to folate deficiency
Warnings/Precautions

Disease-related concerns:

- Folate deficiency: Use caution in patients with possible folate deficiency (eg, malabsorption syndrome, pregnancy, alcoholism).
- G6PD deficiency: Use with caution in patients with possible G6PD deficiency.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorders: Use with caution in patients with a history of seizure disorders.

Concurrent drug therapy issues:

- Leucovorin: When used for more than 3-4 days, it may be advisable to administer leucovorin to prevent hematologic complications.

Other warnings/precautions:

- Monitoring: Monitor CBC and platelet counts every 2 weeks.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate or well-controlled studies in pregnant women. Teratogenicity has been reported in animal studies. If administered during pregnancy (ie, for toxoplasmosis), supplementation of folate is strongly recommended. Pregnancy should be avoided during therapy.
LactationEnters breast milk/not recommended (AAP rates “compatible”)
Breast-Feeding ConsiderationsPyrimethamine enters breast milk and may result in significant systemic concentrations in breast-fed infants. AAP rates as “compatible” (although the manufacturer does not recommend its use during breast-feeding). The effect of concurrent therapy with sulfonamide or dapsone (frequently used with pyrimethamine as combination treatment) must be considered.
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias (large doses)

Central nervous system: Depression, fever, insomnia, lightheadedness, malaise, seizure

Dermatologic: Abnormal skin pigmentation, dermatitis, erythema multiforme, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis

Gastrointestinal: Anorexia, abdominal cramps, atrophic glossitis, diarrhea, vomiting, xerostomia,

Hematologic: Megaloblastic anemia, leukopenia, pancytopenia, thrombocytopenia, pulmonary eosinophilia

Genitourinary: Hematuria

Miscellaneous: Anaphylaxis

Metabolism/Transport Effects**Inhibits** CYP2C9 (moderate), 2D6 (moderate)
Drug Interactions

Antipsychotic Agents (Phenothiazines): Antimalarial Agents may increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Methylfolate: May diminish the therapeutic effect of Pyrimethamine. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Monitoring ParametersCBC, including platelet counts

Nursing: Physical Assessment/MonitoringEvaluate any patient history of renal or hepatic impairment or seizures prior to beginning therapy. When used for more than 3-4 days, it may be advisable to give leucovorin to prevent hematologic complications. Assess potential for interactions with other pharmacological agent patient may be taking (eg, increased potential for toxicities). Evaluate results of laboratory tests, therapeutic effectiveness according to purpose for use, and adverse reactions (eg, arrhythmias, rash, GI disturbance, hematuria, megoblastic anemia) periodically during therapy.. Teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, including platelet counts twice weekly; liver and renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take with meals. Tablets may be crushed to prepare oral suspensions of the drug in water, cherry syrup, or sucrose-containing solutions at a concentration of 1 mg drug/mL of liquid. It is important to complete full course of therapy for full effect. Regular blood tests will be necessary during therapy. If used for prophylaxis, consult with prescriber in order to begin 2 weeks before traveling to endemic areas, continue during travel period, and for 6-10 weeks following return. May cause GI distress or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); dizziness, lightheadedness, insomnia, or changes in mentation (use caution when driving or with tasks that require alertness until response to drug is known); or changes in skin pigmentation or rash. Report persistent GI disturbance (nausea, vomiting, diarrhea, cramping); chest pain or palpitation; unusual fatigue, easy bruising, bleeding, or bloody emesis; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Daraprim)

25 mg (30): $25.99

Mechanism of ActionInhibits parasitic dihydrofolate reductase, resulting in inhibition of vital tetrahydrofolic acid synthesis

Pharmacodynamics/Kinetics

Onset of action: ~1 hour

Absorption: Well absorbed

Distribution: Widely, mainly in blood cells, kidneys, lungs, liver, and spleen; crosses into CSF; crosses placenta; enters breast milk

Protein binding: 80% to 87%

Metabolism: Hepatic

Half-life elimination: 80-95 hours

Time to peak, serum: 1.5-8 hours

Excretion: Urine (20% to 30% as unchanged drug)

Related Information

- Immunization Recommendations
- Malaria Treatment
- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsLeucovorin may be administered in a dosage of 3-9 mg/day for 3 days or 5 mg every 3 days or as required to reverse symptoms of or to prevent hematologic problems due to folic acid deficiency

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Atrophic glossitis has been reported.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause drowsiness, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; mild hepatotoxicity associated with concurrent usage of lorazepam

Pharmacologic CategoryTopical Skin Product

Use: Labeled IndicationsRelieves the itching, irritation, and scalp flaking associated with dandruff and/or seborrheal dermatitis

Dosing: Adults**Dandruff/Seborrhea** (Products should be used at least twice weekly for best results, but may be used with each washing): Topical:

Bar: May be used on body and or scalp; wet area, massage in, and rinse.

Shampoo: Should be applied to wet hair and massaged into scalp; rinse. May be followed with conditioner

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalFor topical use only; avoid eyes

ContraindicationsHypersensitivity to pyrithione zinc or any component of the formulation

Warnings/Precautions

Other warnings/precautions:

- Administration: For external use only; avoid contact with the eyes.

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Head & Shoulders® Sensitive Care: 1% (420 mL, 700 mL) [contains benzyl alcohol]

Head & Shoulders® Smooth & Silky: 1% (420 mL) [contains benzyl alcohol]

Selsun® Salon™ Classic: 1% (384 mL) [contains benzyl alcohol]

Selsun® Salon™ Moisturing: 1% (384 mL) [contains benzyl alcohol]

Selsun® Salon™ Volumizing: 1% (384 mL) [contains benzyl alcohol]

T/Gel® Daily Control: 1% (250 mL) [contains benzyl alcohol]

Zincon®: 1% (120 mL, 240 mL)

Shampoo, topical [with conditioner]:

Head & Shoulders® Citrus Breeze 2-in-1: 1% (420 mL) [contains benzyl alcohol]

Head & Shoulders® Classic Clean 2-in-1: 1% (420 mL, 700 mL) [contains benzyl alcohol]

Head & Shoulders® Dry Scalp Care 2-in-1: 1% (420 mL, 700 mL) [contains benzyl alcohol]

Head & Shoulders® intensive solutions 2-in-1: 2% (251 mL) [contains benzyl alcohol]

Head & Shoulders® Ocean Lift 2-in-1: 1% (420 mL, 700 mL) [contains benzyl alcohol]

Head & Shoulders® Refresh 2-in-1: 2% (420 mL) [contains benzyl alcohol]

Head & Shoulders® Restoring Shine 2-in-1: 1% (420 mL) [contains benzyl alcohol]

Head & Shoulders® Sensitive Care 2-in-1: 1% (420 mL, 700 mL) [contains benzyl alcohol]

Head & Shoulders® Smooth and Silky 2-in-1: 1% (420 mL, 700 mL) [contains benzyl alcohol]

Selsun® Salon™ 2-in-1: 1% (384 mL) [contains benzyl alcohol]

T/Gel® Daily Control 2 in 1: 1% (250 mL) [contains benzyl alcohol]

Soap, topical:

DermaZinc™: 2% (112.5 g) [contains coconut oil]

ZNP®): 2% (119 g) [bar]

Solution, topical [spray/drops]:

DermaZinc™: 0.25% (120 mL)

Generic AvailableNo

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Medication Safety Issues

Sound-alike/look-alike issues:

Quazepam may be confused with oxazepam

Pronunciation(KWAZ e pam)

U.S. Brand NamesDoral®

Canadian Brand NamesDoral®

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsTreatment of insomnia

Dosing: Adults**Hypnotic:** Oral: Initial: 15 mg at bedtime; in some patients, the dose may be reduced to 7.5 mg after a few nights

Dosing: ElderlyDosing should be cautious; begin at lower end of dosing range (ie, 7.5 mg)

Dosing: Hepatic ImpairmentDose reduction may be necessary.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

RestrictionsC-IV

ContraindicationsHypersensitivity to quazepam, other benzodiazepines, or any component of the formulation; sleep apnea; pregnancy

Note: Product labeling does not include narrow-angle glaucoma; however, use in narrow-angle glaucoma is contraindicated with other benzodiazepines.

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.

- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.

- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

- Pediatrics: Safety and efficacy have not been established in pediatric patients.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties. Use lowest effective dose.

- Hypnotic: Appropriate use: Should be used only after evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric or medical illness. A worsening of insomnia or the emergence of new abnormalities of thought or behavior may represent unrecognized psychiatric or medical illness and requires immediate and careful evaluation.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric Considerations Because of the long half-life of one of its active metabolites, quazepam is not a drug of choice in the elderly. Long-acting benzodiazepines have been associated with falls in the elderly and are not recommended for use in older patients.

Pregnancy Risk Factor X

Pregnancy Considerations Adverse events were observed in animal studies. An increased risk of congenital malformations has been observed with other benzodiazepines following exposure during the 1st trimester. Withdrawal symptoms in the neonate and neonatal flaccidity have been reported following maternal use of benzodiazepines during pregnancy. Use during pregnancy is contraindicated.

Lactation Enters breast milk/not recommended (AAP rates “of concern”)

Breast-Feeding Considerations Approximately 0.1% of the maternal dose is found in breast milk.

Adverse Reactions

>10%: Central nervous system: Daytime drowsiness (12%)

<10%:

Central nervous system: Headache (5%), dizziness (2%), fatigue (2%)

Gastrointestinal: Xerostomia (2%), dyspepsia (1%)

Frequency not defined. **Note:** Asterisked (*) reactions are those reported with benzodiazepines.

Cardiovascular: Palpitation

Central nervous system: Abnormal thinking, agitation, amnesia, anxiety, apathy, ataxia, confusion, depression, dystonia*, euphoria, hallucinations*, hyper-/hypokinesia, incoordination, irritability*, malaise, memory impairment*, nervousness, nightmare, paranoid reaction, sleep disturbances*, slurred speech*, speech disorder, stimulation*

Dermatologic: Dermatitis*, pruritus, rash

Endocrine & metabolic: Libido decreased, menstrual irregularities*

Gastrointestinal: Abdominal pain, abnormal taste perception, anorexia, appetite increased/decreased*, constipation, diarrhea, nausea

Genitourinary: Impotence, incontinence, urinary retention*

Hematologic: Blood dyscrasias

Hepatic: Jaundice*, SGOT increased

Neuromuscular & skeletal: Dysarthria*, muscle cramps*, muscle spasticity*, reflex slowing*, rigidity*, tremor, weakness

Ocular: Abnormal vision, blurred vision*, cataract

Miscellaneous: Drug dependence, withdrawal*

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls)

Metabolism/Transport Effects **Substrate** of CYP2C19 (major), and CYP3A4 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Yohimbine: May diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Grapefruit juice may decrease the metabolism of quazepam.

Herb/Nutraceutical: Avoid St John's wort (may increase the metabolism of quazepam).

Monitoring ParametersRespiratory and cardiovascular status; mental status

Nursing: Physical Assessment/MonitoringFor inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions (see Adverse Reactions) at beginning of therapy and periodically with long-term use.

Patient EducationAvoid alcohol and other CNS depressants; avoid activities needing good psychomotor coordination until CNS effects are known; drug may cause physical or psychological dependence; avoid abrupt discontinuation after prolonged use

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Doral®: 15 mg

Generic AvailableNo

ManufacturerQuestcor Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Doral)

7.5 mg (30): $100.99

15 mg (30): $127.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: >95%

Metabolism: Hepatic; forms metabolites (active)- 2-oxoquasepam and N-desalkyl-2-oxoquazepam

Half-life elimination, serum: Quazepam, 2-oxoquasepam: 39 hours; N-desalkyl-2-oxoquazepam: 73 hours

Time to peak, plasma: ~2 hours

Excretion: Urine (31%, only trace amounts as unchanged drug); feces (23%)

Related Information

- Benzodiazepines
- CMS: Long-Term Care Facility Thresholds
- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy Pearls More likely than short-acting benzodiazepine to cause daytime sedation and fatigue. Classified as a long-acting benzodiazepine hypnotic (eg, flurazepam), this long duration of action may prevent withdrawal symptoms when therapy is discontinued. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and abnormal taste perception.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health Comment In 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Quazepam is a long half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Anesthesia and Critical Care Concerns/Other Considerations Quazepam is more likely than short-acting benzodiazepine to cause daytime sedation and fatigue. It is classified as a long-acting benzodiazepine hypnotic (like flurazepam - Dalmane®); this long duration of action may prevent withdrawal symptoms when therapy is discontinued. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

QUEtiapine may be confused with OLANZapine

Seroquel® may be confused with Serentil®, Serzone®, Sinequan®

Pronunciation(kwe TYE a peen)

U.S. Brand NamesSeroquel®; Seroquel® XR

Canadian Brand NamesApo-Quetiapine; CO-Quetiapine; Gen-Quetiapine; Novo-Quetiapine; PMS-Quetiapine; ratio-Quetiapine; Riva-Quetiapine; Sandoz-Quetiapine; Seroquel®; Seroquel® XR

Pharmacologic Category[Antipsychotic Agent, Atypical](Antipsychotic Agent, Atypical)

Use: Labeled IndicationsTreatment of schizophrenia; treatment of acute manic episodes associated with bipolar I disorder (as monotherapy or in combination with lithium or divalproex); maintenance treatment of bipolar I disorder (in combination with lithium or divalproex); treatment of depressive episodes associated with bipolar disorder

Use: Unlabeled/InvestigationalAutism, psychosis (children); psychosis/agitation related to Alzheimer’s dementia

Dosing: Adults

Bipolar disorder:

Depression: Oral:

Immediate release tablet: Initial: 50 mg/day the first day; increase to 100 mg/day on day 2, further increasing by 100 mg/day each day until a target dose of 300 mg/day is reached by day 4. Further increases up to 600 mg/day by day 8 have been evaluated in clinical trials, but no additional antidepressant efficacy was noted.

Extended release tablet: Initial: 50 mg/day the first day; increase to 100 mg on day 2, further increasing by 100 mg/day each day until a target dose of 300 mg/day is reached by day 4.

Mania: Oral:

Immediate release tablet: Initial: 50 mg twice daily on day 1, increase dose in increments of 100 mg/day to 200 mg twice daily on day 4; may increase to a target dose of 800 mg/day by day 6 at increments ≤200 mg/day. Usual dosage range: 400-800 mg/day.

Extended release tablet: Initial: 300 mg on day 1; increase to 600 mg on day 2 and adjust dose to 400-800 mg once daily on day 3, depending on response and tolerance.

Maintenance therapy: Immediate release tablet: 200-400 mg twice daily with lithium or divalproex; **Note:** Average time of stabilization was 15 weeks in clinical trials.

Schizophrenia/psychoses: Oral:

Immediate release tablet: Initial: 25 mg twice daily; increase in increments of 25-50 mg 2-3 times/day on the second and third day, if tolerated, to a target dose of 300-400 mg/day in 2-3 divided doses by day 4. Make further adjustments as needed at intervals of at least 2 days in adjustments of 25-50 mg twice daily. Usual maintenance range: 300-800 mg/day.

Extended-release tablet: Initial: 300 mg once daily; increase in increments of up to 300 mg/day (in intervals of ≥1 day). For dosage requirements <200 mg during initial titration, the immediate release formulation should be used. Usual maintenance range: 400-800 mg/day.

Note: Dose reductions should be attempted periodically to establish lowest effective dose in patients with psychosis. Patients being restarted after 1 week of no drug need to be titrated as above.

Dosing: ElderlyAdults >65 years: 40% lower mean oral clearance of quetiapine in adults >65 years of age; higher plasma levels expected and, therefore, dosage adjustment may be needed; elderly patients usually require 50-200 mg/day of immediate release tablets or 50 mg/day of extended release tablets with a slower titration schedule. Increase immediate release dose by 25-50 mg/day or extended release dose by 50 mg/day to effective dose, based on clinical response and tolerability. If initiated with immediate release tablets, patient may transition to extended release formulation (at equivalent total daily dose) when effective dose has been reached. See “Note” in adult dosing.

Psychosis/agitation related to Alzheimer’s dementia (unlabeled use): Initial: 12.5-50 mg/day; if necessary, gradually increase as tolerated not to exceed 200-300 mg/day

Dosing: PediatricChildren and Adolescents:

Autism (unlabeled use): Oral: 100-350 mg/day (1.6-5.2 mg/kg/day)

Psychosis and mania (unlabeled use): Oral: Initial: 25 mg twice daily; titrate as necessary to 450 mg/day

Dosing: Renal ImpairmentNo dosage adjustment required: 25% lower mean oral clearance of quetiapine than normal subjects; however, plasma concentrations similar to normal subjects receiving the same dose.

Dosing: Hepatic ImpairmentLower clearance in hepatic impairment (30%), may result in higher concentrations. Dosage adjustment may be required.

Immediate release tablet: Oral: Initial: 25 mg/day, increase dose by 25-50 mg/day to effective dose, based on clinical response and tolerability to patient. If initiated with immediate-release formulation, patient may transition to extended-release formulation (at equivalent total daily dose) when effective dose has been reached.

Extended release tablet Oral: Initial: 50 mg/day; increase dose by 50 mg/day to effective dose, based on clinical response and tolerability to patient.

Administration: Oral

Immediate release tablet: May be administered with or without food.

Extended release tablet: Administer without food or with a light meal (≤300 calories), preferably in the evening. Swallow tablet whole; do not break, crush, or chew.

Dietary Considerations

Immediate-release tablet: May be taken with or without food.

Extended release tablet: Take without food or with a light meal (≤300 calories).

StorageStore at controlled room temperature of 25°C (77°F).

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/drug/antidepressants/MG_template.pdf. Dispense to parents or guardians of children and adolescents receiving this medication.

Contraindications

U.S. labeling: There are no contraindications listed in manufacturers labeling.

Canadian labeling: Hypersensitivity to quetiapine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Dementia: See “Disease-related concerns” below.

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor all patients for clinical worsening, suicidality, or unusual changes in behavior; particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increased or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Quetiapine is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants (for any indication) should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. **Quetiapine is FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics.

- Anticholinergic effects: May cause anticholinergic effects (confusion, agitation, constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems. Relative to other antipsychotics, quetiapine has a moderate potency of cholinergic blockade.

- Blood dyscrasias: Leukopenia, neutropenia, and agranulocytosis (sometimes fatal) have been reported in clinical trials and postmarketing reports; presence of risk factors (eg, pre-existing low WBC or history of drug-induced leuko/neutropenia) should prompt periodic blood count assessment and discontinuation at first signs of blood dyscrasias.

- Cataracts: Use has been noted to cause cataracts in animals; lens examination on initiation of therapy and every 6 months is recommended.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is generally much lower relative to typical/conventional antipsychotics). Risk of dystonia (and probably other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Hyperglycemia: Atypical antipsychotics have been associated with development of hyperglycemia; in some cases, may be extreme and associated with ketoacidosis, hyperosmolar coma, or death. Use with caution in patients with diabetes or other disorders of glucose regulation; monitor for worsening of glucose control.

- Hyperlipidemia: Increases in cholesterol and triglycerides have been noted. Use with caution in patients with pre-existing abnormal lipid profile.

- Neuroleptic malignant syndrome (NMS): Use may be associated with neuroleptic malignant syndrome (NMS); monitor for mental status changes, fever, muscle rigidity and/or autonomic instability. This risk in association with quetiapine is very low relative to other antipsychotics.

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May be sedating; use with caution in disorders where CNS depression is a feature. Patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Suicidal ideation: The possibility of a suicide attempt is inherent in psychotic illness or bipolar disorder; use with caution in high-risk patients during initiation of therapy. Prescriptions should be written for the smallest quantity consistent with good patient care.

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

- Weight gain: Significant weight gain has been observed with antipsychotic therapy; incidence varies with product. Monitor waist circumference and BMI.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiac disease, hemodynamic instability, prior myocardial infarction, ischemic heart disease, or hypercholesterolemia.

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Quetiapine is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic disease or impairment; may increase transaminases (primarily ALT). Substantial hepatic metabolism via CYP3A4; may require dose adjustment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease.

- Renal impairment: Use with caution in patients with renal disease.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold. Elderly patients may be at increased risk of seizures due to an increased prevalence of predisposing factors.

- Thyroid disease: Use with caution in patients with thyroid disease.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs due to antiemetic effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Patients using immediate release tablets may be switched to extended release tablets at the same total daily dose taken once daily. Dosage adjustments may be necessary based on response and tolerability.

Other warnings/precautions:

- Withdrawal syndrome: Use caution when withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Abrupt cessation may cause (rarely) acute withdrawal symptoms (eg, nausea, vomiting, or insomnia).

Geriatric ConsiderationsAny changes in disease status in any organ system can result in behavior changes.

Extrapyramidal syndrome symptoms occur less often than with traditional antipsychotics from the phenothiazine and butyrophenone classes. Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

In the treatment of agitated, demented elderly patients, authors of meta-analyses of controlled trials of the response to the traditional antipsychotics (eg, phenothiazines, butyrophenones) in controlling agitation, have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control. In light of significant risks and adverse effects in elderly population compared with limited data demonstrating efficacy in the treatment of dementia related psychosis, aggression, and agitation, an extensive risk:benefit analysis should be performed prior to use.

Pregnancy Risk FactorC
Pregnancy ConsiderationsHealthcare providers are encouraged to enroll women 18-45 years of age exposed to quetiapine during pregnancy in the Atypical Antipsychotics Pregnancy Registry (1-866-961-2388).
LactationEnters breast milk/use caution
Adverse ReactionsActual frequency may be dependant upon dose and/or indication. Unless otherwise noted, frequency of adverse effects is reported for the immediate release oral formulation in adults.

>10%:

Central nervous system: Somnolence (18% to 34%; extended release ≤52%), sedation (30%), headache (17% to 21%), agitation (6% to 20%), dizziness (9% to 18%), extrapyramidal symptoms (8% to 12%)

Endocrine & metabolic: Triglycerides increased (14% to 23%), cholesterol increased (9% to 16%)

Gastrointestinal: Xerostomia (9% to 44%), weight gain (dose-related; 5% to 23%), appetite increased (5%; extended release <5% to 12%)

1% to 10%:

Cardiovascular: Orthostatic hypotension (4% to 7%), tachycardia (6%), syncope (extended release <5%), palpitation (≥1%), peripheral edema (≥1%)

Central nervous system: Fatigue (10%), pain (7%), lethargy (5%), akathisia (extended release <5%), dystonia (extended release <5%), tardive dyskinesia (extended release <5%), anxiety (4%), fever (2%)

Dermatologic: Rash (4%)

Endocrine & metabolic: Hyperglycemia (≥200 mg/dL post glucose challenge or fasting glucose ≥126 mg/dL, 4%)

Gastrointestinal: Constipation (8% to 10%), dyspepsia (dose-related; 5% to 7%), abdominal pain (dose-related; 4% to 7%), vomiting (5% to 6%), drooling (extended release <5%), dysphagia (extended release <5%), gastroenteritis (2%), anorexia (≥1%)

Hematologic: Leukopenia (≥1%)

Hepatic: Transaminases increased (1% to 6%), GGT increased (1%)

Neuromuscular & skeletal: Weakness (5% to 10%), tremor (8%), back pain (3% to 5%), dysarthria (≥1%), hypertonia (≥1%)

Ocular: Blurred vision (extended release <5%), amblyopia (2%)

Respiratory: Pharyngitis (4% to 6%), nasal congestion (5%), rhinitis (3%), cough (≥1%), dyspnea (≥1%)

Miscellaneous: Diaphoresis (≥1%), flu-like syndrome (≥1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abnormal dreams, acute renal failure, agranulocytosis, alkaline phosphatase increased, amnesia, anaphylactic reaction, anaphylaxis, anemia, angina, asthma, bradycardia, bundle branch block, cardiomyopathy, cataract formation, cerebral ischemia, cerebrovascular accident, CHF, confusion, creatinine increased, dehydration, diabetes mellitus, dysuria, eosinophilia, epistaxis, exfoliative dermatitis, hallucinations, hypoglycemia, hyper-/hypothyroidism, hypersensitivity, hypokalemia, hyponatremia, involuntary movements, leukocytosis, lymphadenopathy, myocarditis, neuroleptic malignant syndrome, neutropenia, pancreatitis, pneumonia, priapism, QRS duration increased, QT prolongation, rectal bleeding, restless leg syndrome, rhabdomyolysis, seizure, SIADH, Stevens-Johnson syndrome, ST segment elevation, suicide attempt, thrombocytopenia, tinnitus, T-wave abnormal, T-wave inversion, urinary retention, vertigo

⇧ Metabolism/Transport Effects **Substrate** of CYP2D6 (minor), 3A4 (major)

⇧ Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Atypical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Phenytoin: May increase the metabolism of QUEtiapine. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause excessive impairment in cognition/motor function).

Food: In healthy volunteers, administration of quetiapine (immediate release) with food resulted in an increase in the peak serum concentration and AUC (each by ~15%) compared to the fasting state. Administration of the extended release with a high-fat meal (~800-1000 calories) resulted in an increase in peak serum concentration by 44% to 52% and AUC by 20% to 22% for the 50 mg and 300 mg tablets; administration with a light meal had no significant effect on the C_{max} or AUC.

Herb/Nutraceutical: St John's wort may decrease quetiapine levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersVital signs; fasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually); CBC frequently during first few months of therapy in patients with pre-existing low WBC or a history of drug-induced leukopenia/neutropenia; BMI, personal/family history of obesity, waist circumference; blood pressure; mental status, abnormal involuntary movement scale (AIMS). Weight should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of the initial weight. Patients should have eyes checked for cataracts every 6 months while on this medication. Observe for new or worsening depression, anxiety, irritability, aggression, or other symptoms of unusual behavior, mood, or suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased).

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions (especially drugs affected by P450 enzymes). Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Assess mental status for depression and suicidal ideation. Evaluate for cataracts before initiating treatment and every 6 months during chronic treatment. Monitor weight prior to initiating therapy and at least monthly. Consider titrating to a different antipsychotic agent for weight gain ≥5% of initial weight. Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsFasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually); CBC frequently during first few months of therapy in patients with pre-existing low WBC or a history of drug-induced leukopenia/neutropenia

Patient EducationUse exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results; do not discontinue without consulting prescriber. Avoid alcohol or caffeine and other prescriptions or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, you may experience increased blood sugars. Monitor blood glucose closely. Avoid overeating and/or dehydration. You may experience excess drowsiness, restlessness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); mouth sores or GI upset (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); weight gain; constipation (increased exercise, fluids, fruit, or fiber may help); or postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing). Report persistent CNS effects (eg, somnolence, agitation, insomnia); suicidal ideation; severe dizziness; vision changes; respiratory difficulty; muscle stiffness; high fever; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Seroquel®: 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg

Tablet, extended release:

Seroquel® XR: 50 mg, 200 mg, 300 mg, 400 mg

Generic AvailableNo

ManufacturerAstraZeneca Pharmaceuticals LP

Pricing: U.S. (www.drugstore.com)

Tablets (Seroquel)

25 mg (60): $139.82

50 mg (100): $372.86

100 mg (60): $233.03

200 mg (60): $437.22

300 mg (60): $605.88

400 mg (30): $370.52

Mechanism of ActionQuetiapine is a dibenzothiazepine atypical antipsychotic. It has been proposed that this drug's antipsychotic activity is mediated through a combination of dopamine type 2 (D_2) and serotonin type 2 (5-HT_2) antagonism. It is an antagonist at multiple neurotransmitter receptors in the brain: serotonin 5-HT_{1A} and 5-HT_2, dopamine D_1 and D_2, histamine H_1, and adrenergic alpha$_1$- and alpha$_2$-receptors; but appears to have no appreciable affinity at cholinergic muscarinic and benzodiazepine receptors.

Antagonism at receptors other than dopamine and 5-HT_2 with similar receptor affinities may explain some of the other effects of quetiapine. The drug's antagonism of histamine H_1-receptors may explain the somnolence observed with it. The drug's antagonism of adrenergic alpha$_1$-receptors may explain the orthostatic hypotension observed with it.

Pharmacodynamics/Kinetics

Absorption: Rapidly absorbed following oral administration

Distribution: V_d: 6-14 L/kg; V_{dss}: ~2 days

Protein binding, plasma: 83%

Metabolism: Primarily hepatic; via CYP3A4; forms the metabolite N-desalkyl quetiapine (active) and two inactive metabolites

Bioavailability: 9% ± 4%; tablet is 100% bioavailable relative to solution

Half-life elimination:

Mean: Terminal: Quetiapine: ~6 hours; Extended release: ~7 hours

Metabolite: N-desalkyl quetiapine: 9-12 hours

Time to peak, plasma: Immediate release: 1.5 hours; Extended release: 6 hours

Excretion: Urine (73% as metabolites, <1% as unchanged drug); feces (20%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsQuetiapine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Child/Adolescent ConsiderationsSix children with autistic disorder (mean age: 10.9 years) received 100-350 mg/day (1.6-5.2 mg/kg/day; Martin, 1999). Ten patients with DSM-IV chronic or intermittent psychotic disorders (12.3-15.9 years of age) received quetiapine twice daily starting at 25 mg and reaching 400 mg by day 20. The trial ended on day 23 (McConville, 2000). Thirty manic or mixed bipolar I adolescents (12-18 years of age) received quetiapine 25 mg twice daily with titration to 450 mg/day by day 7 (DelBello, 2001).

Mental Health CommentQuetiapine is an antipsychotic agent of a class often referred to as atypical. It should be noted that the definition of the term “atypical” is not universally agreed upon. Some prefer to describe antipsychotics based on their pharmacological properties. A common feature of all definitions used to describe “atypical” antipsychotics is the lack of significant acute or subacute EPS, at dosages generally associated with antipsychotic actions. Other experts have included definitions of atypicality that include a) failure to increase serum prolactin levels; b) superior efficacy for positive, negative, and cognitive symptoms; and c) lack of evidence of tardive dyskinesia or dystonia following chronic administration.

Clinically, the dosage range for quetiapine is large and depends on what is being targeted. The general dose range for GAD and depression is low (50-300 mg/day), bipolar mania and depression is 300-600 mg/day, while dosages for schizophrenia can range from 300-1200 mg/day.

Tardive dyskinesia (TD) secondary to **typical** antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. The incidence of TD associated with the atypical antipsychotics is estimated to be 0.5% to 1%. It is not clear if this estimate represents a risk associated with mental illness or to what extent drug therapy can be implicated. Atypical antipsychotics appear less likely to cause tardive dyskinesia than typical antipsychotics (fluphenazine, haloperidol).

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Anesthesia and Critical Care Concerns/Other ConsiderationsQuetiapine has a very low incidence of extrapyramidal symptoms such as restlessness and abnormal movement, and is at least as effective as conventional antipsychotics. For patients who have been off quetiapine for more than 1 week, dose titration is necessary when restarting the medication.

Index TermsQuetiapine Fumarate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kwin AG o lide)
Canadian Brand NamesNorprolac®
Pharmacologic CategoryHyperprolactinemia Agent, Dopamine (D2) Agonist
Use: Labeled IndicationsTreatment of hyperprolactinemia due to prolactin-secreting pituitary tumors (microadenoma or macroadenoma) or idiopathic in nature
Dosing: Adults**Hyperprolactinemia:** Oral:

Initial: 0.025 mg/day for 3 days followed by 0.05 mg/day for 3 days (starter pack)

Maintenance (beginning on day 7): 0.075 mg/day; if needed, a further stepwise titration of dose may occur with intervals of at least 1 week minimum; usual maintenance range: 0.075-0.15 mg/day

Maximum dose: Titrate by increasing dose by 0.075-0.15 mg/day no more frequently than every 4 weeks, up to 0.9 mg/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentUse in contraindicated.
Dosing: Hepatic ImpairmentUse in contraindicated.
Administration: OralAdminister with snack at bedtime. Nausea and vomiting may be alleviated by premedicating with a peripheral dopamine antagonist.
StorageStore at 5°C to 30°C (59°F to 86°F). Protect from light and humidity.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to quinagolide or any component of the formulation; hepatic or renal impairment
Warnings/Precautions

Concerns related to adverse effects:

- Fertility changes: Use caution in women of childbearing age; restoration of fertility may occur; patients not wanting to conceive should implement a reliable method of birth control.

- G.I. distress: Use may be associated with frequent (but transient) nausea and vomiting early in therapy; during initial therapy, premedication with a peripheral dopamine antagonist may alleviate these effects and improve tolerance.

- Hypotension: Hypotensive episodes along with syncope may occur with the onset of therapy; monitor blood pressure early in therapy.

- Sedation: Use may be associated with sudden sleep onset and somnolence (especially in patients with Parkinson's disease); patients should be cautioned about performing dangerous tasks such as operating heavy machinery or driving. Use with other agents known to induce somnolence or sleep may be expected to potentiate these risks.

Disease-related concerns:

- Psychosis: Use with caution in patients with prior psychotic disorders; the onset of acute psychosis has rarely been observed with use of quinagolide (reversible upon discontinuation).

Special populations:

- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.

- Pregnancy: Use caution when discontinuing therapy in patients who become pregnant. Monitor for headache or visual field deterioration which may indicate tumor enlargement and a need to resume therapy. Treatment may not exclude the need for radiation and/or surgical intervention if appropriate.

Pregnancy ConsiderationsAnimal studies revealed no embryotoxic or teratogenic effects. Fertility may be restored with treatment. Discontinue use with confirmed pregnancy unless medically necessary to continue. No increase in the incidence of abortion has been seen with a discontinuation of the drug during pregnancy. The reinstitution of therapy may be necessary in patients who display symptoms of tumor enlargement (headaches, visual field changes).
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsBy inhibiting prolactin secretion, quinagolide suppresses lactation.
Adverse Reactions

>10%:

Central nervous system: Dizziness, fatigue, headache

Gastrointestinal: Nausea, vomiting

1% to 10%:

Cardiovascular: Edema (2%), flushing (1%), hypotension (1%), palpitation (1%), syncope (1%)

Central nervous system: Sedation (3%), insomnia (2%), concentration decreased (1%), malaise (1%), mood lability (1%)

Gastrointestinal: Abdominal pain/discomfort (3%), constipation (3%), anorexia (2%), dyspepsia (2%), diarrhea (1%), weight gain (1%)

Endocrine & metabolic: Breast pain (1%)

Neuromuscular & skeletal: Weakness (3%), extremity pain (1%)

Respiratory: Nasal congestion (2%)

<1%: Acute psychosis, bilirubin increased, creatine phosphokinase increased, hematocrit decreased, hemoglobin decreased, neutropenia, potassium increased, somnolence, transaminases increased, triglycerides increased

Metabolism/Transport EffectsAgents with dopamine antagonist activity may be expected to decrease the effects of quinagolide.

Drug InteractionsNo drug interactions have been reported with quinagolide. However, the following may be anticipated based on the mechanism of action.

Antihypertensives: May potentiate the hypotensive effects of quinagolide.

Dopamine antagonists (eg, phenothiazines, haloperidol, pimozide, metoclopramide, prochlorperazine):.Effects of quinagolide may be decreased.

Peripheral dopamine-2 antagonists (eg, domperidone): May improve tolerance during initial therapy.

Ethanol/Nutrition/Herb InteractionsEthanol: May reduce tolerability of quinagolide.

Monitoring ParametersCBC, basic metabolic panel, transaminases, triglycerides, prolactin levels; blood pressure; sedation, mental changes

Monitoring: Lab TestsCBC, basic metabolic panel, transaminases, triglycerides, prolactin levels

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Combination package [not available in the U.S.]:

Norprolac® [CAN] [starter pack]:

Tablet, as hydrochloride: 0.025 mg (3s)

Tablet, as hydrochloride: 0.05 mg (3s)

Tablet, as hydrochloride: 0.075 mg (3s)

Tablet, as hydrochloride:

Norprolac® [CAN]: 0.075 mg, 0.15 mg [not available in the U.S.]

Generic AvailableNo

Manufacturer

Ferring Pharmaceuticals

Mechanism of ActionSelective dopamine D$_2$ receptor agonist that exerts a direct inhibitory effect on cells (lactotrophs) in the anterior pituitary gland which synthesize and secrete prolactin; not an ergot alkaloid

Pharmacodynamics/Kinetics

Onset of action: 2 hours; maximum effect: 4-6 hours

Duration: >24 hours

Absorption: Rapid

Distribution: V$_d$: 100 L

Protein binding: 90%

Metabolism: Hepatic; via conjugation (glucuronide and sulfate)

Bioavailability: 4%

Half-life elimination: 11.5 hours; steady state: 17 hours

Time to peak, serum: 30-60 minutes

Excretion: Urine (50%); feces (40%); >95% as metabolites

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and fatigue are common; may cause psychosis, sedation, insomnia, decreased concentration, and mood lability.

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concurrent use with lithium, carbamazepine, valproic acid, and SSRIs may produce additive effects. Effects of quinagolide may be decreased by antipsychotics (dopamine antagonists).

U.S. Brand NamesAccuretic®; Quinaretic

Canadian Brand NamesAccuretic®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension (not for initial therapy)

Dosing: Adults

Hypertension: Oral:

Patients with inadequate response to quinapril monotherapy: Quinapril 10 mg/hydrochlorothiazide 12.5 mg **or** quinapril 20 mg/hydrochlorothiazide 12.5 mg once daily

Patients with adequate blood pressure control on hydrochlorothiazide 25 mg/day, but significant potassium loss: Quinapril 10 mg/hydrochlorothiazide 12.5 mg **or** quinapril 20 mg/hydrochlorothiazide 12.5 mg once daily

Note: Clinical trials of quinapril/hydrochlorothiazide combinations used quinapril doses of 2.5-40 mg/day and hydrochlorothiazide doses of 6.25-25 mg/day.

Dosing: ElderlyIf previous response to individual components is unknown, initial dose selection should be cautious, at the low end of adult dosage range; titration should occur at 1- to 2-week intervals.

Dosing: PediatricSafety and efficacy have not been established.

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute/1.73 m^2 or serum creatinine ≤3 mg/dL: Use is not recommended.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to quinapril, hydrochlorothiazide, sulfonamide-derived drugs, or any other component of the formulation; angioedema related to previous treatment with an ACE inhibitor; anuria

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.
- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.
- Photosensitivity: Photosensitization may occur.
- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.
- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.
- Collagen vascular disease: Use quinapril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide can cause systemic lupus erythematosus (SLE) exacerbation or activation.
- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.
- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.
- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.
- Renal artery stenosis: Use quinapril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective). Contraindicated in anuric patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss, or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsCombination products are not recommended for first-line treatment. Hydrochlorothiazide is not effective in patients with a Cl_{cr} <30 mL/minute, therefore, it may not be a useful agent in many elderly patients. Due to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with CHF and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in the elderly and causes little or no CNS confusion; use lowest dose recommendations initially. Adjust for renal function. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy Considerations See individual agents.

LactationEnters breast milk/use caution

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (5%), somnolence (1%)

Neuromuscular & skeletal: Weakness (1%)

Renal: Serum creatinine increased (3%), blood urea nitrogen increased (4%)

Respiratory: Cough (3%), bronchitis (1%)

<1%: Acute renal failure, agranulocytosis, alopecia, anaphylactoid reaction, angina pectoris, angioedema, arrhythmia, arthralgia, calcium increased (serum), cerebrovascular accident, cholesterol increased (serum), diaphoresis increased, dyspnea, erythema multiforme, exfoliative dermatitis, gastrointestinal hemorrhage, glucose increased (serum), heart failure, hypercalcemia, hyperkalemia, hypertensive crisis, impotence, liver function test abnormalities, magnesium increased (serum), malaise, MI, nervousness, orthostatic hypotension, palpitation, pancreatitis, paresthesia, pemphigus, photosensitivity, pruritus, sinusitis, tachycardia, uric acid increased (serum), thrombocytopenia, triglyceride increased (serum), vertigo, xerostomia

Postmarketing and/or case reports: Abnormal gait, abnormal vision, albuminuria, amnesia, anemia, arthritis, ascites, asthma, bradycardia, cellulitis, cholestatic jaundice, cor pulmonale, deep thrombosis, diarrhea, esophagitis, generalized edema, hematuria, hemiplegia, hepatitis, kidney function abnormality, macropapular rash, meningism, myopathy, myositis, nephrosis, paralysis, petechiae, pneumonia, pyuria, shock, urticaria, vasculitis, weight loss

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Quinolone Antibiotics: Quinapril may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Tetracycline Derivatives: Quinapril may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

10/12.5: Quinapril 10 mg and hydrochlorothiazide 12.5 mg

20/12.5: Quinapril 20 mg and hydrochlorothiazide 12.5 mg

20/25: Quinapril 20 mg and hydrochlorothiazide 25 mg

Accuretic® 10/12.5, Quinaretic 10/12.5: Quinapril 10 mg and hydrochlorothiazide 12.5 mg

Accuretic® 20/12.5, Quinaretic 20/12.5: Quinapril 20 mg and hydrochlorothiazide 12.5 mg

Accuretic® 20/25, Quinaretic 20/25: Quinapril 20 mg and hydrochlorothiazide 25 mg

Related Information

- Hydrochlorothiazide
- Quinapril

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness; may rarely cause insomnia or depression

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine. May decrease lithium clearance, resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels.

Index TermsHydrochlorothiazide and Quinapril

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Accupril® may be confused with Accolate®, Accutane®, AcipHex®, Monopril®

International issues:

Accupril® may be confused with Acepril® which is a brand name for lisinopril in Denmark, a brand name for enalapril in Hungary and Switzerland, and a brand name for captopril in Great Britain

Pronunciation(KWIN a pril)

U.S. Brand NamesAccupril®

Canadian Brand NamesAccupril®; GD-Quinapril

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension; treatment of heart failure

Use: Unlabeled/InvestigationalTreatment of left ventricular dysfunction after myocardial infarction; pediatric hypertension; to delay the progression of nephropathy and reduce risks of cardiovascular events in hypertensive patients with type 1 or 2 diabetes mellitus

Dosing: Adults

Hypertension: Oral: Initial: 10-20 mg once daily, adjust according to blood pressure response at peak and trough blood levels; initial dose may be reduced to 5 mg in patients receiving diuretic therapy if the diuretic is continued.

Usual dose range (JNC 7): 10-40 mg once daily

Heart failure: Oral: Initial: 5 mg once or twice daily, titrated at weekly intervals to 20-40 mg daily in 2 divided doses; target dose (heart failure): 20 mg twice daily (ACC/AHA 2005 Heart Failure Guidelines)

Dosing: ElderlyOral: Initial: 2.5-5 mg/day; increase dosage at increments of 2.5-5 mg at 1- to 2-week intervals; adjust for renal impairment.

Dosing: Pediatric**Hypertension (unlabeled use):** Oral: Initial 5-10 mg once daily; maximum: 80 mg/day

Dosing: Renal ImpairmentLower initial doses should be used; after initial dose (if tolerated), administer initial dose twice daily; may be increased at weekly intervals to optimal response:

Hypertension: Oral: Initial:

Cl_{cr} >60 mL/minute: Administer 10 mg/day

Cl_{cr} 30-60 mL/minute: Administer 5 mg/day

Cl_{cr} 10-30 mL/minute: Administer 2.5 mg/day

Heart failure: Oral: Initial:

Cl_{cr} >30 mL/minute: Administer 5 mg/day

Cl_{cr} 10-30 mL/minute: Administer 2.5 mg/day

Dosing: Hepatic ImpairmentIn patients with alcoholic cirrhosis, hydrolysis of quinapril to quinaprilat is impaired; however, the subsequent elimination of quinaprilat is unaltered.

Calculations

- Creatinine Clearance: Adults

StorageStore at room temperature.

ReconstitutionTo prepare solution for oral administration, mix prior to administration and use within 10 minutes.

Compatibility**Incompatible** with aqueous solutions.

ContraindicationsHypersensitivity to quinapril or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See special populations.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss, or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsDue to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with CHF and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in elderly and causes little or no CNS confusion; use lowest dose recommendations initially. Adjust for renal function. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, quinapril is considered pregnancy category C during the first trimester. Based on human data, quinapril is considered pregnancy category D if used during the second and third trimesters (per the manufacturer; however, one study suggests that fetal injury may occur at anytime during pregnancy). Quinapril crosses the placenta. First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsQuinapril is excreted in breast milk. The manufacturer recommends that caution be exercised when administering quinapril to nursing women.

Pregnancy & Lactation, In-Depth

- Quinapril in Pregnancy & Lactation

Adverse Reactions**Note:** Frequency ranges include data from hypertension and heart failure trials. Higher rates of adverse reactions have generally been noted in patients with CHF. However, the frequency of adverse effects associated with placebo is also increased in this population.

1% to 10%:

Cardiovascular: Hypotension (3%), chest pain (2%), first-dose hypotension (up to 3%)

Central nervous system: Dizziness (4% to 8%), headache (2% to 6%), fatigue (3%)

Dermatologic: Rash (1%)

Endocrine & metabolic: Hyperkalemia (2%)

Gastrointestinal: Vomiting/nausea (1% to 2%), diarrhea (2%)

Neuromuscular & skeletal: Myalgias (2% to 5%), back pain (1%)

Renal: BUN/serum creatinine increased (2%, transient elevations may occur with a higher frequency), worsening of renal function (in patients with bilateral renal artery stenosis or hypovolemia)

Respiratory: Upper respiratory symptoms, cough (2% to 4%; up to 13% in some studies), dyspnea (2%)

<1% (Limited to important or life-threatening): Anaphylactoid reaction, angioedema, arthralgia, edema, back pain, malaise, viral infection, palpitation, vasodilation, tachycardia, heart failure, hyperkalemia, MI, cerebrovascular accident, hypertensive crisis, angina, orthostatic hypotension, arrhythmia, shock, hemolytic anemia, xerostomia, constipation, gastrointestinal hemorrhage, pancreatitis, abnormal liver function tests, somnolence, vertigo, syncope, nervousness, depression, insomnia, paresthesia, alopecia, increased diaphoresis, pemphigus, pruritus, exfoliative dermatitis, photosensitivity, dermatopolymyositis, impotence, acute renal failure, eosinophilic pneumonitis, amblyopia, pharyngitis, agranulocytosis, hepatitis, thrombocytopenia

A syndrome which may include fever, myalgia, arthralgia, interstitial nephritis, vasculitis, rash, eosinophilia and positive ANA, and elevated ESR has been reported with ACE inhibitors. In addition, pancreatitis, hepatic necrosis, neutropenia, and/or agranulocytosis (particularly in patients with collagen-vascular disease or renal impairment) have been associated with many ACE inhibitors.

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Quinolone Antibiotics: Quinapril may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Tetracycline Derivatives: Quinapril may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringUse caution in presence of renal impairment, hypovolemia, collagen vascular diseases, valvular stenosis, hyperkalemia, or before, during, or immediately after anesthesia. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact fluid balance or cardiac status). It is advisable to administer first dose in prescriber's office with careful blood pressure monitoring (hypotension or angioedema can occur at any time during treatment, especially following first dose). Evaluate results of laboratory tests, therapeutic effectiveness (blood pressure and cardiac status), and adverse reactions (eg, hypovolemia, angioedema, postural hypotension) on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed; do not alter dose or discontinue without consulting prescriber. Take first dose at bedtime or when sitting down (hypotension may occur). This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause increased cough (if persistent or bothersome, contact prescriber); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); headache (consult prescriber for approved analgesic); dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or muscle or back pain (consult prescriber for approved analgesic). Immediately report swelling of face, mouth, lips, tongue, or throat; chest pain or respiratory difficulty; persistent cough; persistent pain in muscles, joints, or back; skin rash; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 5 mg, 10 mg, 20 mg, 40 mg

Accupril®: 5 mg, 10 mg, 20 mg, 40 mg

Generic AvailableYes
ManufacturerPfizer
Pricing: U.S. (www.drugstore.com)

Tablets (Accupril)

5 mg (30): $56.99

10 mg (30): $55.97

20 mg (30): $54.99

40 mg (30): $55.99

Tablets (Quinapril HCl)

5 mg (30): $21.99

10 mg (30): $19.99

20 mg (30): $26.97

40 mg (30): $21.99

Mechanism of ActionCompetitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion; a CNS mechanism may also be involved in hypotensive effect as angiotensin II increases adrenergic outflow from CNS; vasoactive kallikreins may be decreased in conversion to active hormones by ACE inhibitors, thus reducing blood pressure
Pharmacodynamics/Kinetics

Onset of action: 1 hour

Duration: 24 hours

Absorption: Quinapril: ≥60%

Protein binding: Quinapril: 97%; Quinaprilat: 97%

Metabolism: Rapidly hydrolyzed to quinaprilat, the active metabolite

Half-life elimination: Quinapril: 0.8 hours; Quinaprilat: 3 hours; increases as Cl_{cr} decreases

Time to peak, serum: Quinapril: 1 hour; Quinaprilat: ~2 hours

Excretion: Urine (50% to 60% primarily as quinaprilat)

Related Information

- Angiotensin Agents
- Heart Failure (Systolic)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness; may rarely cause insomnia or depression
Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels
Cardiovascular Considerations

Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, a history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after four years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Anesthesia and Critical Care Concerns/Other ConsiderationsACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. ACE inhibitors are also indicated in patients postmyocardial infarction in whom left ventricular ejection fraction is <40%.

ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. To prevent this, discontinue diuretics 2-3 days prior to initiating quinapril; may restart diuretics if blood pressure is not controlled by quinapril alone. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Index TermsQuinapril Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

QuiNIDine may be confused with cloNIDine, quiNINE, Quinora®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(KWIN i deen)

Canadian Brand NamesApo-Quinidine®; BioQuin® Durules™; Novo-Quinidin; Quinate®

Pharmacologic CategoryAntiarrhythmic Agent, Class Ia

Use: Labeled IndicationsProphylaxis after cardioversion of atrial fibrillation and/or flutter to maintain normal sinus rhythm; prevent recurrence of paroxysmal supraventricular tachycardia, paroxysmal AV junctional rhythm, paroxysmal ventricular tachycardia, paroxysmal atrial fibrillation, and atrial or ventricular premature contractions; has activity against *Plasmodium falciparum* malaria

Dosing: Adults

Note: Dosage expressed in terms of the salt: 267 mg of quinidine gluconate = 275 mg of quinidine polygalacturonate = 200 mg of quinidine sulfate.

Test dose for idiosyncratic reaction: Oral, I.M.: 200 mg administered several hours before full dosage (to determine possibility of idiosyncratic reaction)

Antiarrhythmic:

Oral:

Sulfate: 100-600 mg/dose every 4-6 hours; begin at 200 mg/dose and titrate to desired effect (maximum daily dose: 3-4 g)

Gluconate: 324-972 mg every 8-12 hours

I.M.: 400 mg/dose every 4-6 hours

I.V.: 200-400 mg/dose diluted and given at a rate ≤10 mg/minute

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Note: Dosage expressed in terms of the salt: 267 mg of quinidine gluconate = 200 mg of quinidine sulfate.

Test dose for idiosyncratic reaction (sulfate, oral or gluconate, I.M.): Children: 2 mg/kg or 60 mg/m^2

Antiarrhythmic: Oral (quinidine sulfate): Children: 15-60 mg/kg/day in 4-5 divided doses or 6 mg/kg every 4-6 hours; usual 30 mg/kg/day or 900 mg/m^2/day given in 5 daily doses

I.V. **not** recommended (quinidine gluconate): Children: 2-10 mg/kg/dose given at a rate ≤10 mg/minute every 3-6 hours as needed

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Administer 75% of normal dose.

Hemodialysis effects: Slightly hemodialyzable (5% to 20%); 200 mg supplemental dose posthemodialysis is recommended; not dialyzable (0% to 5%) by peritoneal dialysis.

Dosing: Hepatic ImpairmentLarger loading dose may be indicated; reduce maintenance doses by 50% and monitor serum levels closely.

Calculations

- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Give around-the-clock to promote less variation in peak and trough serum levels. Maximum I.V. infusion rate: 10 mg/minute. Minimize use of PVC tubing to enhance bioavailability.

Administration: I.V. DetailpH: 5.5-7.0 (injection)
Administration: OralDo not crush, chew, or break sustained release dosage forms. Give around-the-clock to promote less variation in peak and trough serum levels.
Dietary ConsiderationsAdminister with food or milk to decrease gastrointestinal irritation. Avoid changes in dietary salt intake.
StorageDo not use discolored parenteral solution.
CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Diazepam, milrinone. **Incompatible:** Furosemide. **Variable (consult detailed reference):** Heparin.

Compatibility when admixed: Compatible: Bretylium, cimetidine, milrinone, ranitidine, verapamil. **Incompatible:** Atracurium. **Variable (consult detailed reference):** Amiodarone.

Extemporaneously PreparedA 10 mg/mL oral liquid preparation made from tablets and three different vehicles (cherry syrup, a 1:1 mixture of Ora-Sweet® and Ora-Plus®, or a 1:1 mixture of Ora-Sweet® SF and Ora-Plus®) was stable for 60 days when stored in amber plastic prescription bottles in the dark at room temperature (25°C) or under refrigeration (5°C). Grind six 200 mg tablets in a mortar into a fine powder; add 15 mL of the vehicle and mix well to form a uniform paste; mix while adding the vehicle in geometric proportions to **almost** 120 mL; transfer to a calibrated bottle and qsad to 120 mL; label “shake well” and “protect from light” (Allen 1998).

Allen LV and Erickson MA, “Stability of Bethanechol Chloride, Pyrazinamide, Quinidine Sulfate, Rifampin, and Tetracycline in Extemporaneously Compounded Oral Liquids,” *Am J Health Syst Pharm*, 1998, 55(17):1804-9.

ContraindicationsHypersensitivity to quinidine or any component of the formulation; thrombocytopenia; thrombocytopenic purpura; myasthenia gravis; heart block greater than first degree; idioventricular conduction delays (except in patients with a functioning artificial pacemaker); those adversely affected by anticholinergic activity; concurrent use of quinolone antibiotics which prolong QT interval, cisapride, amprenavir, or ritonavir
Allergy Considerations

- QuiNIDine/QuiNINE Derivative Allergy

Warnings/Precautions

Boxed warnings:

- Arrhythmias: Appropriate use: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Hepatotoxicity: Has been associated with severe hepatotoxic reactions, including granulomatous hepatitis.
- Hypersensitivity reactions: With use, hypersensitivity reactions may occur.
- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation.

Disease-related concerns:

- Arrhythmias: Appropriate use: **[U.S. Boxed Warning]: Antiarrhythmic drugs have not been shown to enhance survival in non-life-threatening ventricular arrhythmias and may increase mortality; the risk is greatest with structural heart disease. Quinidine may increase mortality in treatment of atrial fibrillation/flutter.**
- Atrial fibrillation/flutter: May increase ventricular response rate in patients with atrial fibrillation or flutter; control AV conduction before initiating.
- Conduction disturbances: Use with caution in patients at risk for heart block; can unmask sick sinus syndrome (causes bradycardia).
- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.
- G6PD deficiency: Hemolysis may occur in patients with G6PD (glucose-6-phosphate dehydrogenase) deficiency.
- Heart failure (HF): Use with caution in patients with HF; may precipitate or exacerbate condition.
- Hepatic impairment: Use with caution in patients with hepatic impairment; reduced dosage recommended.

Concurrent drug therapy issues:

- Antiarrhythmics: Use with caution with concurrent use of other antiarrhythmics.
- Digoxin: Use may cause digoxin-induced toxicity; adjust digoxin's dose.

Dosage form specific issues:

- Different salts: Do not interchange the different salt products.

Other warnings/precautions:

- CAST trial: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide. An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

Geriatric ConsiderationsClearance may be decreased with a resultant increased half-life. Must individualize dose. Bioavailability and half-life are increased in the elderly due to decreases in both renal and hepatic function with age.

Pregnancy Risk FactorC

LactationEnters breast milk/compatible

Adverse Reactions

Frequency not defined: Hypotension, syncope

>10%:

Cardiovascular: QT_c prolongation (modest prolongation is common, however, excessive prolongation is rare and indicates toxicity)

Central nervous system: Lightheadedness (15%)

Gastrointestinal: Diarrhea (35%), upper GI distress, bitter taste, anorexia, nausea, vomiting, stomach cramping (22%)

1% to 10%:

Cardiovascular: Angina (6%), palpitation (7%), new or worsened arrhythmia (proarrhythmic effect)

Central nervous system: Syncope (1% to 8%), headache (7%), fatigue (7%), sleep disturbance (3%), tremor (2%), nervousness (2%), incoordination (1%)

Dermatologic: Rash (5%)

Neuromuscular & skeletal: Weakness (5%)

Ocular: Blurred vision

Otic: Tinnitus

Respiratory: Wheezing

<1% (Limited to important or life-threatening): Tachycardia, QT_c prolongation (excessive), torsade de pointes, heart block, ventricular fibrillation, ventricular tachycardia, paradoxical increase in ventricular rate during atrial fibrillation/flutter, exacerbated bradycardia (in sick sinus syndrome), vascular collapse, confusion, delirium, vertigo, hearing impaired, respiratory depression, pneumonitis, bronchospasm, fever, urticaria, flushing, exfoliative rash, psoriaform rash, pruritus, lymphadenopathy, hemolytic anemia, vasculitis, thrombocytopenic purpura, thrombocytopenia, pancytopenia, uveitis, angioedema, agranulocytosis, sicca syndrome, arthralgia, myalgia, CPK increased, drug-induced lupus-like syndrome, cerebral hypoperfusion (possibly resulting in ataxia, apprehension, and seizure), acute psychotic reactions, depression, hallucinations, mydriasis, disturbed color perception, night blindness, scotoma, optic neuritis, visual field loss, photosensitivity, abnormal pigmentation, granulomatous hepatitis, hepatotoxic reaction (rare), eczematous dermatitis, livedo reticularis

Postmarketing and/or case reports: Melanin pigmentation of the hard palate, esophagitis, nephropathy, cholestasis, pneumonitis, lichen planus

Note: Cinchonism, a syndrome which may include tinnitus, high-frequency hearing loss, deafness, vertigo, blurred vision, diplopia, photophobia, headache, confusion, and delirium has been associated with quinidine use. Usually associated with chronic toxicity, this syndrome has also been described after brief exposure to a moderate dose in sensitive patients. Vomiting and diarrhea may also occur as isolated reactions to therapeutic quinidine levels.

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 2D6 (strong), 3A4 (strong)

Drug Interactions

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Antiarrhythmic Agents (Class Ia) may enhance the QTc-prolonging effect of Amiodarone. Amiodarone may increase the metabolism of Antiarrhythmic Agents (Class Ia). *Risk D: Consider therapy modification*

Antacids: May decrease the excretion of QuiNIDine. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of QuiNIDine. Management: Itraconazole, voriconazole, and posaconazole are specifically contraindicated with quinidine. Use of quinidine with any azole antifungal may require quinidine dose adjustment and should be done with caution and close monitoring. *Risk X: Avoid combination*

Barbiturates: May increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Beta-Blockers: QuiNIDine may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Dihydropyridine): May decrease the serum concentration of QuiNIDine. **Exceptions:** Felodipine; Nisoldipine. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May increase the serum concentration of QuiNIDine. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May decrease the excretion of QuiNIDine. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Cardiac Glycosides: QuiNIDine may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: QuiNIDine may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dextromethorphan: QuiNIDine may decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Dihydrocodeine: QuiNIDine may diminish the analgesic effect of Dihydrocodeine. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of QuiNIDine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Haloperidol: QuiNIDine may increase the serum concentration of Haloperidol. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Hydrocodone: QuiNIDine may diminish the analgesic effect of Hydrocodone. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Kaolin: May decrease the absorption of QuiNIDine. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of QuiNIDine. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: QuiNIDine may enhance the adverse/toxic effect of Mefloquine. Specifically, the risk for QTc-prolongation and the risk for convulsions may be increased. Management: Avoid concurrent use, and delay administration of mefloquine until at least 12 hours after the last dose of quinidine when possible. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: QuiNIDine may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

Primidone: May increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of QuiNIDine. Fluvoxamine appears to be the only SSRI of concern. **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk D: Consider therapy modification*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): QuiNIDine may enhance the anticoagulant effect of Vitamin K Antagonists. Note that the prothrombin time might be unchanged in the face of increased bleeding. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Dietary salt intake may alter the rate and extent of quinidine absorption. A decrease in dietary salt may lead to an increase in quinidine serum concentrations. Avoid changes in dietary salt intake. Quinidine serum levels may be increased if taken with food. Food has a variable effect on absorption of sustained release formulation. The rate of absorption of quinidine may be decreased following the ingestion of grapefruit juice. In addition, CYP3A4 metabolism of quinidine may be reduced by grapefruit juice. Grapefruit juice should be avoided. Excessive intake of fruit juices or vitamin C may decrease urine pH and result in increased clearance of quinidine with decreased serum concentration. Alkaline foods may result in increased quinidine serum concentrations.

Herb/Nutraceutical: St John's wort may decrease quinidine levels. Avoid ephedra (may worsen arrhythmia).

Monitoring ParametersCardiac monitor required during I.V. administration; CBC, liver and renal function tests, should be routinely performed during long-term administration

Reference RangeTherapeutic: 2-5 mcg/mL (SI: 6.2-15.4 μmol/L). Patient-dependent therapeutic response occurs at levels of 3-6 mcg/mL (SI: 9.2-18.5 μmol/L). Optimal therapeutic level is method dependent; >6 mcg/mL (SI: >18 μmol/L).

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. I.V. requires use of infusion pump and continuous cardiac and hemodynamic monitoring. Assess results of laboratory tests, therapeutic effectiveness (monitor cardiac functioning closely), and adverse reactions at beginning of therapy, when titrating dosage, and on a regular basis with long-term therapy. **Note:** Quinidine has a low TI and overdose may easily produce severe and life-threatening reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsRoutine CBC, liver and renal function during long-term administration

Patient EducationTake exactly as directed, around-the-clock; do not take additional doses or discontinue without consulting prescriber. Do not crush, chew, or break sustained release dosage forms. Do not take with grapefruit juice. You will need regular cardiac checkups and blood tests while taking this medication. You may experience dizziness, drowsiness, or visual changes (use caution when driving or engaging in tasks requiring alertness until response to drug is known); abnormal taste, nausea or vomiting, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); headaches (prescriber may recommend mild analgesic); or diarrhea (yogurt or boiled milk may help; if persistent consult prescriber). Report chest pain, palpitation, or erratic heartbeat; respiratory difficulty or wheezing; CNS changes (confusion, delirium, fever, consistent dizziness); skin rash; sense of fullness or ringing in ears; or vision changes. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as gluconate: 80 mg/mL (10 mL) [equivalent to quinidine base 50 mg/mL]

Tablet, as sulfate: 200 mg, 300 mg

Tablet, extended release, as gluconate: 324 mg [equivalent to quinidine base 202 mg]

Tablet, extended release, as sulfate: 300 mg [equivalent to quinidine base 249 mg]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Quinidine Gluconate CR)

324 mg (90): $60.08

Tablet, controlled release (Quinidine Sulfate CR)

300 mg (90): $46.99

Tablets (Quinidine Sulfate)

200 mg (90): $19.99

300 mg (90): $36.99

Mechanism of ActionClass Ia antiarrhythmic agent; depresses phase O of the action potential; decreases myocardial excitability and conduction velocity, and myocardial contractility by decreasing sodium influx during depolarization and potassium efflux in repolarization; also reduces calcium transport across cell membrane

Pharmacodynamics/Kinetics

Distribution: V_d: Adults: 2-3.5 L/kg, decreased with congestive heart failure, malaria; increased with cirrhosis; crosses placenta; enters breast milk

Protein binding:

Newborns: 60% to 70%; decreased protein binding with cyanotic congenital heart disease, cirrhosis, or acute myocardial infarction

Adults: 80% to 90%

Metabolism: Extensively hepatic (50% to 90%) to inactive compounds

Bioavailability: Sulfate: 80%; Gluconate: 70%

Half-life elimination, plasma: Children: 2.5-6.7 hours; Adults: 6-8 hours; prolonged with elderly, cirrhosis, and congestive heart failure

Excretion: Urine (15% to 25% as unchanged drug)

- Malaria Treatment

Dental Health: Effects on Dental TreatmentWhen taken over a long period of time, the anticholinergic side effects from quinidine can cause a reduction of saliva production or secretion contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsQuinidine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause dizziness; may rarely cause confusion or delirium

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone. May cause anemia; use caution with clozapine and carbamazepine. Concurrent use with TCAs may raise serum levels or produce AV block; avoid combination. Concurrent use with beta-blockers may increase bradycardia.

Cardiovascular ConsiderationsAs with other Class Ia agents, it is prudent to avoid quinidine use in patients with cardiovascular disease, particularly recent myocardial infarction and heart failure, due to a possible increase in proarrhythmia and mortality. Quinidine may be used to pharmacologically convert atrial fibrillation to normal sinus rhythm. Patients should be monitored (ECG) in a controlled setting when initiating therapy. Therapy should be discontinued or the dose reduced if the QT interval increases ≥25% from baseline. Proarrhythmia (torsade de pointes) may occur early or after months of therapy. It is important to note (see Drug Interactions) that quinidine may increase digoxin levels by twofold, often necessitating a reduction of the digoxin dosage by 50% when quinidine therapy is initiated.

Index Terms Quinidine Gluconate; Quinidine Polygalacturonate; Quinidine Sulfate

Medication Safety Issues

Sound-alike/look-alike issues:

QuiNINE may be confused with quiNIDine

Pronunciation(KWYE nine)

U.S. Brand NamesQualaquin™

Canadian Brand NamesApo-Quinine®; Novo-Quinine; Quinine-Odan™

Pharmacologic CategoryAntimalarial Agent

Use: Labeled IndicationsIn conjunction with other antimalarial agents, treatment of uncomplicated chloroquine-resistant *P. falciparum* malaria

Use: Unlabeled/InvestigationalTreatment of *Babesia microti* infection in conjunction with clindamycin

Note: Prevention/treatment of nocturnal leg cramps (unapproved) removed following FDA-issued warning regarding severe adverse events (eg, cardiac arrhythmias, thrombocytopenia, and severe hypersensitivity reactions) and potentially serious drug interactions associated with quinine; use not justified in this condition.

Dosing: Adults

Treatment of chloroquine-resistant malaria: 648 mg every 8 hours for 7 days with tetracycline, doxycycline, or clindamycin

> **Note:** Actual duration of treatment for malaria may be dependent upon the geographic region or pathogen.

Babesiosis (unlabeled use): 650 mg every 8 hours for 7 days with clindamycin

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of chloroquine-resistant malaria (CDC guidelines): 30 mg/kg/day in divided doses every 8 hours for 3-7 days with tetracycline, doxycycline, or clindamycin (consider risk versus benefit of using tetracycline or doxycycline in children <8 years of age).

> **Note:** Actual duration of treatment for malaria may be dependent upon the geographic region or pathogen.

Babesiosis (unlabeled use): 25 mg/kg/day divided every 8 hours for 7 days with clindamycin.

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 8-12 hours

Cl_{cr} <10 mL/minute: Administer every 24 hours

Severe chronic renal failure not on dialysis: Initial dose: 648 mg followed by 324 mg every 12 hours

Dialysis: Administer dose after dialysis

Not removed by hemo- or peritoneal dialysis; dose as for Cl_{cr} <10 mL/minute.

Continuous arteriovenous or hemodialysis: Dose as for Cl_{cr} 10-50 mL/minute.

Dosing: Hepatic Impairment

Child-Pugh Class B: No dosing adjustment required; monitor closely

Child-Pugh Class C: Data not available

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAvoid use of aluminum- or magnesium-containing antacids because of drug absorption problems. Swallow dose whole to avoid bitter taste. May be administered with food.

Dietary ConsiderationsTake with food to decrease incidence of gastric upset.

StorageStore at 25°C to 30°C (77°F to 86°F); do not refrigerate or freeze.

ContraindicationsHypersensitivity to quinine or any component of the formulation; hypersensitivity to mefloquine or quinidine (cross sensitivity reported); prolonged QT interval; myasthenia gravis; optic neuritis; G6PD deficiency; history of black water fever; thrombotic thrombocytopenia purpura, hemolytic uremic syndrome, thrombocytopenia

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Severe hypersensitivity reactions (eg, Stevens-Johnson syndrome, anaphylactic shock) have occurred; discontinue following any signs of sensitivity. Other events, including thrombocytopenia and hemolytic uremic syndrome, may also be attributed to hypersensitivity reactions.
- Hypoglycemia: Use may cause significant hypoglycemia.

Disease-related concerns:

- Altered cardiac conduction: Use with caution in patients with atrial fibrillation or flutter. Use with caution in patients with clinical conditions which may prolong the QT interval or cause cardiac arrhythmias; use contraindicated in patients with QT prolongation.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.
- QT prolonging agents: Use caution with medications which may prolong the QT interval or cause cardiac arrhythmias.

Other warnings/precautions:

- Nocturnal leg cramps: Because of the potential for severe and/or life-threatening side effects (eg, cardiac arrhythmias, thrombocytopenia, and severe hypersensitivity reactions) and serious drug interactions, as well as the absence of clinical effectiveness, quinine is no longer recommended for the treatment of nocturnal leg cramps. In addition, an FDA warning issued (December 2006) stated that due to these potential serious events, the risks associated with quinine use do not justify its use in the unapproved/unlabeled prevention and treatment of leg cramps.

Geriatric ConsiderationsQuinine's efficacy as a treatment for nocturnal leg cramps is not well supported in the medical and pharmacy literature. The FDA's decision to remove all quinine products (except one that is indicated for the treatment of malaria) indicates that quinine's benefits for nocturnal leg cramps do not out weigh its risks.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects have been reported in some animal studies. Quinine crosses the human placenta. Cord plasma to maternal plasma quinine ratios have been reported as 0.18-0.46 and should not be considered therapeutic to the infant. Teratogenic effects, optic nerve hypoplasia, and deafness have been reported in the infant following maternal use of very high doses; however, therapeutic doses used for malaria are generally considered safe. Quinine may also cause significant hypoglycemia when used during pregnancy. Malaria infection in pregnant women may be more severe than in nonpregnant women. The CDC recommends the use of quinine sulfate for the treatment of chloroquine-resistant *P. falciparum* malaria during pregnancy. Pregnant women should be advised not to travel to areas of *P. falciparum* resistance to chloroquine.

LactationEnters breast milk/use caution (AAP rate "compatible")

Breast-Feeding ConsiderationsBased on limited data, it is estimated that nursing infants would receive <0.4% of the maternal dose from breast-feeding.

Adverse Reactions

Frequency not defined.

Cardiovascular: Atrial fibrillation, atrioventricular block, bradycardia, cardiac arrest, chest pain, hypotension, irregular rhythm, nodal escape beats, palpitation, postural hypotension, QT prolongation, syncope, tachycardia, torsade de pointes, unifocal premature ventricular contractions, U waves, vasodilation, ventricular fibrillation, ventricular tachycardia

Central nervous system: Aphasia, ataxia, chills, coma, confusion, disorientation, dizziness, dystonic reaction, fever, flushing, headache, mental status altered, restlessness, seizure, suicide, vertigo

Dermatologic: Acral necrosis, allergic contact dermatitis, bullous dermatitis, bruising, cutaneous rash (urticaria, papular, scarlatinal), cutaneous vasculitis, diaphoresis, exfoliative dermatitis, erythema multiforme, petechiae, photosensitivity, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis

Endocrine & metabolic: Hypoglycemia

Gastrointestinal: Abdominal pain, anorexia, diarrhea, esophagitis, gastric irritation, nausea, vomiting

Hematologic: Agranulocytosis, aplastic anemia, coagulopathy, disseminated intravascular coagulation, hemolytic anemia, hemolytic uremic syndrome, hemorrhage, hypoprothrombinemia, leukopenia, neutropenia, pancytopenia, thrombocytopenia, thrombotic thrombocytopenic purpura

Hepatic: Granulomatous hepatitis, hepatitis, jaundice, liver function test abnormalities

Neuromuscular & skeletal: Myalgia, tremor, weakness

Ocular: Blindness, blurred vision (with or without scotomata), color vision disturbance, diminished visual fields, diplopia, night blindness, optic neuritis, photophobia, pupillary dilation, vision loss (sudden)

Otic: Deafness, hearing impaired, tinnitus

Respiratory: Asthma, dyspnea, pulmonary edema

Renal: Acute interstitial nephritis, hemoglobinuria, renal failure, renal impairment

Miscellaneous: Black water fever, hypersensitivity syndrome, lupus anticoagulant, lupus-like syndrome

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C19 (minor), 3A4 (major); **Inhibits** CYP2C8 (moderate), 2C9 (moderate), 2D6 (moderate), 3A4 (weak)

Drug Interactions

Antihypertensives: Herbs (Hypotensive Properties) may enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): Antimalarial Agents may increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Cardiac Glycosides: QuiNINE may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the adverse/toxic effect of other Herbs (Hypotensive Properties). Excessive blood pressure lowering may manifest. *Risk C: Monitor therapy*

Mefloquine: QuiNINE may enhance the adverse/toxic effect of Mefloquine. Specifically, the risk for QTc-prolongation and the risk for convulsions may be increased. Mefloquine may increase the serum concentration of QuiNINE. Management: Avoid concurrent use, and delay administration of mefloquine until at least 12 hours after the last dose of quinine when possible. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease quinine levels. Black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, and shepherd's purse may cause excessive decreases in blood pressure.

Test InteractionsPositive Coombs' [direct]; false elevation of urinary steroids (when assayed by Zimmerman method) and catecholamines

Monitoring ParametersMonitor CBC with platelet count, liver function tests, blood glucose, ophthalmologic examination

Reference RangeToxic: >10 mcg/mL

Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy. Use caution in presence of cardiac arrhythmias (quinine has quinidine-like activity) and myasthenia gravis. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased or decreased level/effects and toxicity [digoxin, beta-blockers, warfarin, oxycodone, lidocaine, etc]). Evaluate therapeutic effectiveness (according to purpose for therapy) and adverse reactions (monitor for cinchonism with larger doses or long-term therapy). Teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor CBC with platelet count, liver function tests, blood glucose, ophthalmologic examination

Patient EducationDo not take any new medication during therapy unless approved by prescriber (avoid use of any aluminum-containing antacids). Take on schedule as directed, with full 8 oz of water with or without food. Do not increase dose without consulting prescriber; overdose can cause severe systemic effects. You will need to return for follow-up blood tests. May cause severe headache (consult prescriber for approved analgesic); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report any vision changes (blurring, night-blindness, double vision, etc); ringing in ears; or other persistent side effects. Seek emergency help for chest pain, respiratory difficulty, or seizures. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, as sulfate: 325 mg [DSC]

Qualaquin™: 324 mg

Tablet, as sulfate: 260 mg [DSC]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Qualaquin)

324 mg (30): $143.29

Mechanism of ActionDepresses oxygen uptake and carbohydrate metabolism; intercalates into DNA, disrupting the parasite's replication and transcription; cardiovascular effects similar to quinidine

Pharmacodynamics/Kinetics

Absorption: Readily, mainly from upper small intestine

Distribution: 2.5-7.1 L/kg; varies with severity of infection

Intraerythrocytic levels are ~30% to 50% of the plasma concentration; distributes poorly to the CSF (~2% to 7% of plasma concentration)

Protein binding: 69% to 92% in healthy subjects; 78% to 95% with malaria

Metabolism: Primarily hepatic via CYP450 enzymes, including CYP3A4 and 2C19; forms metabolites; major metabolite, 3-hydroxyquinine, is less active than parent

Bioavailability: 76% to 88% in healthy subjects; increased with malaria

Half-life elimination:

Children: ~3 hours in healthy subjects; ~12 hours with malaria

Healthy adults: 10-13 hours

Time to peak, serum:

Children: 2 hours in healthy subjects; 4 hours with malaria

Adults: 1-3 hours in healthy subjects; 1.2-11 hours with malaria

Excretion: Urine (<20% as unchanged drug)

Related Information

- Malaria Treatment

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease serum concentrations of quinine; CYP2D6 inhibitor; may interact with TCAs or beta-blockers; monitor

Cardiovascular ConsiderationsIt is very important that the physician's orders be clear when prescribing quinine so as to avoid possible confusion and cardiac toxicity of inadvertent quinidine therapy.

Index TermsQuinine Sulfate

English

English

Jump To Field (Select Field Name)

Pronunciation(kwi NYOO pris tin & dal FOE pris tin)

U.S. Brand NamesSynercid®

Canadian Brand NamesSynercid®

Pharmacologic CategoryAntibiotic, Streptogramin

Use: Labeled IndicationsTreatment of serious or life-threatening infections associated with vancomycin-resistant *Enterococcus faecium* bacteremia; treatment of complicated skin and skin structure infections caused by methcillin-susceptible *Staphylococcus aureus* or *Streptococcus pyogenes*

Has been studied in the treatment of a variety of infections caused by *Enterococcus faecium* (not *E. fecalis*) including vancomycin-resistant strains. May also be effective in the treatment of serious infections caused by *Staphylococcus* species including those resistant to methicillin.

Dosing: Adults

Vancomycin-resistant*Enterococcus faecium*: I.V.: 7.5 mg/kg every 8 hours

Complicated skin and skin structure infection: I.V.: 7.5 mg/kg every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricLimited information: Dosages similar to adult dosing have been used in the treatment of complicated skin/soft tissue infections and infections caused by vancomycin-resistant *Enterococcus faecium*

CNS shunt infection due to vancomycin-resistant*Enterococcus faecium*: I.V.: 7.5 mg/kg/dose every 8 hours. Concurrent intrathecal doses of 1-2 mg/day have been administered for up to 68 days.

Dosing: Renal ImpairmentNo adjustment is necessary in renal failure, hemodialysis, or peritoneal dialysis.

Dosing: Hepatic ImpairmentPharmacokinetic data suggest dosage adjustment may be necessary; however, specific recommendations have not been proposed.

Administration: I.V.Line should be flushed with 5% dextrose in water prior to and following administration. Infusion should be completed over 60 minutes (toxicity may be increased with shorter infusion). If severe venous irritation occurs following peripheral administration of quinupristin/dalfopristin diluted in 250 mL 5% dextrose in water, consideration should be given to increasing the infusion volume to 500 mL or 750 mL, changing the infusion site, or infusing by a peripherally-inserted central catheter (PICC) or a central venous catheter.

StorageStore unopened vials under refrigeration (2°C to 8°C/36°F to 46°F).

ReconstitutionReconstitute single dose vial with 5 mL of 5% dextrose in water or sterile water for injection. Swirl gentle to dissolve; do not shake (to limit foam formation). The reconstituted solution should be diluted within 30 minutes. Stability of the diluted solution prior to the infusion is established as 5 hours at room temperature or 54 hours if refrigerated at 2°C to 8°C. Reconstituted solution should be added to at least 250 mL of 5% dextrose in water for peripheral administration (increase to 500 mL or 750 mL if necessary to limit venous irritation). An infusion volume of 100 mL may be used for central line infusions. Do not freeze solution.

Compatibility Stable in D_5W. **Incompatible** with saline.

ContraindicationsHypersensitivity to quinupristin, dalfopristin, pristinamycin, or virginiamycin, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Arthralgias/myalgias: May cause arthralgias and/or myalgias with use; reduction of dosing frequency may improve.
- Hyperbilirubinemia: May cause hyperbilirubinemia (>5 times ULN) possibly through competition for excretory pathways.
- Phlebitis: May cause pain and phlebitis when infused through a peripheral line (not relieved by hydrocortisone or diphenhydramine).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Concurrent drug therapy issues:

- Cisapride: Concurrent therapy with cisapride (which may prolong QT_c interval and lead to arrhythmias) should be avoided.
- Drugs metabolized by CYP3A4: May inhibit the metabolism of many drugs metabolized by CYP3A4.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Geriatric ConsiderationsNo pharmacokinetic changes in the elderly in one study. No dose adjustment necessary.

Pregnancy Risk FactorB

Pregnancy ConsiderationsBecause adverse effects were not observed in animal reproduction studies, quinupristin/dalfopristin is classified pregnancy category B. There are no adequate and well-controlled studies of quinupristin/dalfopristin in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if quinupristin/dalfopristin is excreted in human milk. The manufacturer recommends caution if administering quinupristin/dalfopristin to a nursing woman. The increased molecular weight of quinupristin/dalfopristin may minimize excretion into human milk. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Quinupristin and Dalfopristin in Pregnancy & Lactation

Adverse Reactions

>10%:

Hepatic: Hyperbilirubinemia (3% to 35%)

Local: Inflammation at infusion site (38% to 42%), local pain (40% to 44%), local edema (17% to 18%), infusion site reaction (12% to 13%)

Neuromuscular & skeletal: Arthralgia (up to 47%), myalgia (up to 47%)

1% to 10%:

Central nervous system: Pain (2% to 3%), headache (2%)

Dermatologic: Pruritus (2%), rash (3%)

Endocrine & metabolic: Hyperglycemia (1%)

Gastrointestinal: Nausea (3% to 5%), diarrhea (3%), vomiting (3% to 4%)

Hematologic: Anemia (3%)

Hepatic: GGT increased (2%), LDH increased (3%)

Local: Thrombophlebitis (2%)

Neuromuscular & skeletal: CPK increased (2%)

<1%: Abdominal pain, allergic reaction, anaphylactoid reaction, anxiety, apnea, arrhythmia, bone pain, BUN increased, cardiac arrest, chest pain, coagulation disorder, confusion, constipation, creatinine increased, diaphoresis, dizziness, dysautonomia, dyspepsia, dyspnea, encephalopathy, fever, gastrointestinal hemorrhage, gout, hematuria, hemolysis, hemolytic anemia, hepatitis, hyperkalemia, hypertonia, hypoglycemia, hyponatremia, hypotension, hypoventilation, hypovolemia, infection, insomnia, leg cramps, maculopapular rash, mesenteric artery occlusion, myasthenia, neck rigidity, neuropathy, oral candidiasis, palpitation, pancreatitis, pancytopenia, paraplegia, paresthesia, pericarditis, peripheral edema, phlebitis, pleural effusion, pseudomembranous colitis, respiratory distress, seizure, shock, skin ulcer, stomatitis, syncope, thrombocytopenia, tremor, transaminases increased, urticaria, vaginitis, vasodilation

Metabolism/Transport EffectsQuinupristin: **Inhibits** CYP3A4 (weak)

Drug Interactions

Calcium Channel Blockers: Quinupristin may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk C: Monitor therapy*

CycloSPORINE: Quinupristin may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess allergy history prior to starting treatment. Use caution in presence of hepatic or renal impairment. Assess effectiveness and interactions of other pharmacological agents (eg, cisapride). See Administration prior to starting infusion for exact infusion protocols. Infusion site must be closely monitored (may cause venous irritation). Assess effectiveness (reduction of infection) and adverse reactions (eg, arthralgia, headache, rash, hyperglycemia, opportunistic infection [fever, chills, sore throat, burning urination, fatigue], pseudomembranous colitis, hyperbilirubinemia, dyspnea, ataxia). Teach patient possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsCulture and sensitivity

Patient EducationThis drug can only be administered by intravenous infusion. Report immediately any pain, irritation, redness, burning, or swelling at infusion site. You may experience other side effects. Report headache; rash; nausea; vomiting; diarrhea; pain; heat or swelling in muscle areas, especially in lower extremities; respiratory difficulty, tremors; or difficulty speaking. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Synercid®: 500 mg: Quinupristin 150 mg and dalfopristin 350 mg

Generic AvailableNo

Mechanism of ActionQuinupristin/dalfopristin inhibits bacterial protein synthesis by binding to different sites on the 50S bacterial ribosomal subunit thereby inhibiting protein synthesis

Pharmacodynamics/Kinetics

Distribution: Quinupristin: 0.45 L/kg; Dalfopristin: 0.24 L/kg

Protein binding: Moderate

Metabolism: To active metabolites via nonenzymatic reactions

Half-life elimination: Quinupristin: 0.85 hour; Dalfopristin: 0.7 hour (mean elimination half-lives, including metabolites: 3 and 1 hours, respectively)

Excretion: Feces (75% to 77% as unchanged drug and metabolites); urine (15% to 19%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay rarely cause anxiety, confusion, or insomnia
Mental Health: Effects on Psychiatric TreatmentMay rarely produce pancytopenia; caution with clozapine and carbamazepine
Index TermsPristinamycin; RP-59500

Special Alerts

Clopidogrel (Plavix®) and Proton Pump Inhibitors (PPIs): Ongoing Safety Review - January 2009

The U.S. Food and Drug Administration (FDA) is communicating important information regarding an ongoing safety review of clopidogrel and its effectiveness when used with proton pump inhibitors (PPIs).

Clopidogrel is a prodrug requiring hepatic conversion via CYP3A4 and/or CYP2C19 to its active metabolite. Impaired clopidogrel conversion to its active metabolite may be due to either CYP450 polymorphisms or drug-drug interactions resulting in suboptimal antiplatelet activity.

A PPI is often prescribed with the combination of aspirin and clopidogrel to prevent gastrointestinal bleeding. A number of PPIs are available and include esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole. Several studies have reported greater clinical event rates (eg, myocardial infarction, death) or greater platelet reactivity associated with concurrent use of clopidogrel and a PPI (Ho, 2008; Pezella, 2008; Gilard, 2006). Similarly, a prospective, randomized, double-blind trial demonstrated a reduction in antiplatelet activity when omeprazole and clopidogrel are used concurrently (Gilard, 2008). Another controlled trial with the PPI lansoprazole also found evidence of a possible interaction resulting in less antiplatelet activity (Small, 2008). This interaction is thought to result from competitive inhibition of the CYP2C19-mediated activation of clopidogrel by omeprazole and other PPIs, which are all metabolized to at least some degree by CYP2C19. In contrast, one study with esomeprazole and pantoprazole did not find evidence of reduced antiplatelet activity when administered with clopidogrel (Siller-Matula, 2009), highlighting the need for additional studies to determine the degree to which individual PPIs may differ in their potential for interacting with clopidogrel.

The manufacturer of Plavix® has agreed to conduct further studies to better understand the effect of other drugs (including PPIs) and genetic factors on the effectiveness of clopidogrel. The FDA is recommending that healthcare providers continue to prescribe clopidogrel while reevaluating the need for prescription or over-the-counter (OTC) PPIs in patients taking clopidogrel. Patients should continue taking clopidogrel as directed. If taking a PPI with clopidogrel, patients should consult with their healthcare provider.

For more information, healthcare professionals may refer to the following FDA website:
http://www.fda.gov/cder/drug/early_comm/clopidogrel_bisulfate.htm

Medication Safety Issues

Sound-alike/look-alike issues:

AcipHex® may be confused with Acephen®, Accupril®, Aricept®, pHisoHex®

Rabeprazole may be confused with aripiprazole,donepezil, lansoprazole, omeprazole, raloxifene

Pronunciation(ra BEP ra zole)

U.S. Brand NamesAcipHex®

Canadian Brand NamesAcipHex®; Novo-Rabeprazole EC; Pariet®; PMS-Rabeprazole; Ran-Rabeprazole; Sandoz-Rabeprazole

Pharmacologic CategoryProton Pump Inhibitor; Substituted Benzimidazole

Use: Labeled IndicationsShort-term (4-8 weeks) treatment and maintenance of erosive or ulcerative gastroesophageal reflux disease (GERD); symptomatic GERD; short-term (up to 4 weeks) treatment of duodenal ulcers; long-term treatment of pathological hypersecretory conditions, including Zollinger-Ellison syndrome; *H. pylori* eradication (in combination with amoxicillin and clarithromycin)

Canadian labeling: Additional uses (not in U.S. labeling): Treatment of nonerosive reflux disease (NERD); treatment of gastric ulcers

Use: Unlabeled/InvestigationalMaintenance of duodenal ulcer

Dosing: Adults

GERD, erosive/ulcerative: Oral: Treatment: 20 mg once daily for 4-8 weeks; if inadequate response, may repeat up to an additional 8 weeks; maintenance: 20 mg once daily

Canadian labeling: Oral: 20 mg once daily for 4 weeks; if inadequate response, may repeat for an additional 4 weeks (lack of symptom control after 4 weeks warrants further evaluation); maintenance: 10 mg once daily (maximum: 20 mg once daily)

GERD, symptomatic: Oral: Treatment: 20 mg once daily for 4 weeks; if inadequate response, may repeat for an additional 4 weeks

Canadian labeling: 10 mg once daily (maximum: 20 mg once daily) for 4 weeks; lack of symptom control after 4 weeks warrants further evaluation

Duodenal ulcer: Oral: 20 mg/day before breakfast for 4 weeks; additional therapy may be required for some patients

Gastric ulcers (*Canadian labeling*): Oral: 20 mg once daily up to 6 weeks; additional therapy may be required for some patients

***H. pylori*eradication:** Oral: 20 mg twice daily for 7 days; to be administered with amoxicillin 1000 mg and clarithromycin 500 mg, also given twice daily for 7 days.

Hypersecretory conditions: Oral: 60 mg once daily; dose may need to be adjusted as necessary. Doses as high as 100 mg once daily and 60 mg twice daily have been used, and continued as long as necessary (up to 1 year in some patients).

NERD (*Canadian labeling*): Oral: Treatment: 10 mg (maximum: 20 mg once daily) for 4 weeks; lack of symptom control after 4 weeks warrants further evaluation

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Short-term treatment of GERD:***U.S. labeling:* Children ≥12 years: 20 mg once daily for ≤8 weeks

Dosing: Renal ImpairmentNo dosage adjustment required.

Dosing: Hepatic Impairment

Mild to moderate: Elimination decreased; no dosage adjustment required.

Severe: Use caution.

Administration: OralMay be administered with or without food; best if taken before breakfast. Do not crush, split, or chew tablet. May be administered with an antacid.

Dietary ConsiderationsMay be taken with or without food; best if taken before breakfast.

StorageStore at 25°C (77°F). Protect from moisture.

ContraindicationsHypersensitivity to rabeprazole, substituted benzimidazoles (ie, esomeprazole, lansoprazole, omeprazole, pantoprazole), or any component of the formulation

Allergy Considerations

- Proton Pump Inhibitor, Benzimidazole Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Atrophic gastritis: Long-term omeprazole therapy has caused atrophic gastritis (by biopsy); this may also occur with rabeprazole.
- Carcinoma: No reports of enterochromaffin-like (ECL) cell carcinoids, dysplasia, or neoplasia has occurred.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Gastrointestinal infection (eg, *Salmonella, Campylobacter*): Use of proton pump inhibitors may increase risk of these infections.
- Hepatic impairment: Use caution in patients with severe hepatic impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Geriatric ConsiderationsNo difference in efficacy or safety was noted in elderly subjects as compared to younger subjects. No dosage adjustment is necessary in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNot shown to be teratogenic in animal studies, however, adequate and well-controlled studies have not been done in humans; use during pregnancy only if clearly needed

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

1% to 10%:

Central nervous system: Pain (3%), headache (2% to 5%)

Gastrointestinal: Diarrhea (3%), flatulence (3%), constipation (2%), nausea (2%)

Respiratory: Pharyngitis (3%)

Miscellaneous: Infection (2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abdomen enlarged, abdominal pain, abnormal stools, abnormal vision, agitation, agranulocytosis, albuminuria, allergic reaction, alopecia, amblyopia, anaphylaxis, anemia, angina pectoris, angioedema, anorexia, apnea, arrhythmia, arthralgia, arthritis, ascites, asthma, bloody diarrhea, bone pain, bradycardia, breast enlargement, bullous and other drug eruptions of skin, bundle branch block, bursitis, cataract, cellulitis, cerebral hemorrhage, chest pain substernal, cholangitis, cholecystitis, cholelithiasis, colitis, coma, contact dermatitis, convulsions, corneal opacity, CPK increased, cystitis, deafness, delirium, depression, diaphoresis, diabetes mellitus, diplopia, disorientation, dizziness, duodenitis, dysmenorrhea, dyspepsia, dysphagia, dyspnea, dysuria, edema, electrocardiogram abnormal, embolus, epistaxis, erythema multiforme, esophageal stenosis, esophagitis, extrapyramidal syndrome, eye hemorrhage, facial edema, fever, fungal dermatitis, gastritis, gastroenteritis, gastrointestinal hemorrhage, gingivitis, glaucoma, glossitis, gout, gynecomastia, hematuria, hemolytic anemia, hepatic encephalopathy, hepatic cirrhosis, hepatic enzymes increased, hepatitis, hepatoma, hernia, hyperammonemia, hypercholesteremia, hyperglycemia, hyperkinesia, hyperlipemia, hypertension, hyper-/hypothyroidism, hypertonia, hypokalemia, hyponatremia, hypoxia, impotence, injection site hemorrhage/pain/reaction, insomnia, interstitial nephritis, interstitial pneumonia, jaundice, kidney calculus, leukocytosis, leukopenia, leukorrhea, liver fatty deposit, lymphadenopathy, malaise, melena, menorrhagia, metrorrhagia, MI, migraine, myalgia, neck rigidity, nervousness, neuralgia, neuropathy, neutropenia, orchitis, palpitation, pancreatitis, pancytopenia, paresthesia, peripheral edema, photosensitivity, polycystic kidney, polyuria, proctitis, pruritus, PSA increased, psoriasis, pulmonary embolus, QT_c prolongation, rash, rectal hemorrhage, retinal degeneration, rhabdomyolysis, salivary gland enlargement, sinus bradycardia, skin discoloration, somnolence, Stevens-Johnson syndrome, stomatitis, strabismus, sudden death, supraventricular tachycardia, syncope, tachycardia, taste abnormal, thrombocytopenia, thrombophlebitis, thrombosis, thirst (rare) tinnitus, toxic epidermal necrolysis, tremor, TSH increased, ulcerative colitis, urinary incontinence, urticaria, vasodilation, ventricular arrhythmias, vertigo, vomiting, weakness, weight gain/loss, xerostomia

Metabolism/Transport Effects **Substrate** (major) of CYP2C19, 3A4; **Inhibits** CYP2C8 (moderate), 2C19 (moderate), 2DC (weak), 3A4 (weak)
Drug Interactions

Atazanavir: Proton Pump Inhibitors may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Clopidogrel: Proton Pump Inhibitors may diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: Proton Pump Inhibitors may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Proton Pump Inhibitors may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Erlotinib: Proton Pump Inhibitors may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Fluconazole: May increase the serum concentration of Proton Pump Inhibitors. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Indinavir: Proton Pump Inhibitors may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: Proton Pump Inhibitors may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Itraconazole: Proton Pump Inhibitors may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Ketoconazole: Proton Pump Inhibitors may decrease the serum concentration of Ketoconazole. Ketoconazole may increase the serum concentration of Proton Pump Inhibitors. *Risk D: Consider therapy modification*

Mesalamine: Proton Pump Inhibitors may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; proton pump inhibitors would be expected to interact in a similar manner. *Risk X: Avoid combination*

Methotrexate: Proton Pump Inhibitors may decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Mycophenolate: Proton Pump Inhibitors may decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Nelfinavir: Proton Pump Inhibitors may decrease serum concentrations of the active metabolite(s) of Nelfinavir. Proton Pump Inhibitors may decrease the serum concentration of Nelfinavir. *Risk X: Avoid combination*

Saquinavir: Proton Pump Inhibitors may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Tipranavir: May decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

Voriconazole: Proton Pump Inhibitors may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause gastric mucosal irritation).

Food: High-fat meals may delay absorption, but C_{max} and AUC are not altered.

Herb/Nutraceutical: St John's wort may increase the metabolism and thus decrease the levels/effects of rabeprazole.

Nursing: Physical Assessment/MonitoringAssess other medications, especially those dependent on cytochrome P450 metabolism (eg, digoxin) and those requiring acid environment for absorption (eg, ketoconazole, ampicillin). Monitor therapeutic effectiveness (reduction in symptoms) and adverse reactions and toxicity. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.

Patient EducationTake as directed. Swallow whole, do not crush, split, or chew. Follow recommended diet and activity instructions. Avoid alcohol. You may experience headache (use of mild analgesic may help) or other side effects. Report these to prescriber if they persist. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet, delayed release, enteric coated, as sodium:

AcipHex®: 20 mg

Pariet® [CAN]: 10 mg, 20 mg

Generic AvailableNo

ManufacturerEisai Inc

Pricing: U.S. (www.drugstore.com)

Tablet, EC (Aciphex)

20 mg (30): $159.99

Mechanism of ActionPotent proton pump inhibitor; suppresses gastric acid secretion by inhibiting the parietal cell H+/K+ ATP pump

Pharmacodynamics/Kinetics

Onset of action: Within 1 hour

Duration: 24 hours

Absorption: Oral: Well absorbed within 1 hour

Protein binding, serum: ~96%

Metabolism: Hepatic via CYP3A and 2C19 to inactive metabolites

Bioavailability: Oral: ~52%

Half-life elimination (dose dependent): 1-2 hours

Time to peak, plasma: 2-5 hours

Excretion: Urine (90% primarily as thioether carboxylic acid metabolites); remainder in feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia, anxiety, dizziness, depression, nervousness, somnolence, vertigo, convulsions, abnormal dreams; may rarely cause agitation, amnesia, confusion, extrapyramidal syndrome

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsPariprazole

English English

Jump To Field (Select Field Name)

Pronunciation(RAY beez i MYUN GLOB yoo lin, HYU man)
U.S. Brand NamesHyperRAB™ S/D; Imogam® Rabies-HT
Canadian Brand NamesHyperRAB™ S/D; Imogam® Rabies Pasteurized
Pharmacologic CategoryImmune Globulin
Use: Labeled IndicationsPart of postexposure prophylaxis of persons with rabies exposure who lack a history of pre-exposure or postexposure prophylaxis with rabies vaccine or a recently documented neutralizing antibody response to previous rabies vaccination
Dosing: Adults**Postexposure prophylaxis:** Local wound infiltration: 20 units/kg in a single dose, RIG should always be administered as part of rabies vaccine regimen. If anatomically feasible, the full rabies immune globulin dose should be infiltrated around and into the wound(s); remaining volume should be administered I.M. at a site distant from the vaccine administration site. If rabies vaccine was initiated without rabies immune globulin, rabies immune globulin may be administered through the seventh day after the administration of the first dose of the vaccine. Administration of RIG is not recommended after the seventh day post vaccine since an antibody response to the vaccine is expected during this time period.

Note: Persons known to have an adequate titer or who have previously received postexposure prophylaxis with rabies vaccine should not receive RIG.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: I.M.Postexposure wound infiltration: If anatomically feasible, the full rabies immune globulin dose should be infiltrated around and into the wound(s); remaining volume should be administered I.M. in the deltoid muscle of the upper arm or lateral thigh muscle. The gluteal area should be avoided to reduce the risk of sciatic nerve damage. Do not administer rabies vaccine in the same syringe or at the same administration site as RIG.
Administration: I.V.Do not administer I.V.
StorageStore between 2°C to 8°C (36°F to 46°F); do not freeze. Discard product exposed to freezing.
ContraindicationsThere are no contraindications listed within the FDA-approved manufacturer's labeling.
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available. Use with caution in patients with isolated immunoglobulin A deficiency or a history of systemic hypersensitivity to human immunoglobulins.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with thrombocytopenia or coagulation disorders; I.M. injections may be contraindicated.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Other warnings/precautions:

- Administration: Not for intravenous administration.

Geriatric ConsiderationsNo special considerations are needed for initiating therapy. No specific data relevant to the elderly to date.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not be conducted. Pregnancy is not a contraindication to postexposure prophylaxis.
Adverse ReactionsFrequency not defined.

Central nervous system: Fever (mild), headache, malaise

Dermatologic: Angioedema, rash, urticaria

Local: Soreness at injection site, tenderness, stiffness

Renal: Nephrotic syndrome

Miscellaneous: Anaphylaxis

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever

Vaccine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

HyperRAB™ S/D: 150 int. units/mL (2 mL, 10 mL) [solvent/detergent treated]

Imogam® Rabies-HT: 150 int. units/mL (2 mL, 10 mL) [heat treated]

Generic AvailableNo

Mechanism of ActionRabies immune globulin is a solution of globulins dried from the plasma or serum of selected adult human donors who have been immunized with rabies vaccine and have developed high titers of rabies antibody. It generally contains 10% to 18% of protein of which not less than 80% is monomeric immunoglobulin G.

Rabies Vaccine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(RAY beez vak SEEN)
U.S. Brand NamesImovax® Rabies; RabAvert®
Canadian Brand NamesImovax® Rabies; RabAvert®
Pharmacologic CategoryVaccine, Inactivated (Viral)
Use: Labeled IndicationsPre-exposure and postexposure vaccination against rabies

The Advisory Committee on Immunization Practices (ACIP) recommends a primary course of prophylactic immunization (pre-exposure vaccination) for the following:

- Persons with continuous risk of infection including rabies research laboratory and biologics production workers
- Persons with frequent risk of infection in areas where rabies is enzootic, including rabies diagnostic laboratory workers, cavers, veterinarians and their staff, animal control and wildlife workers; persons who frequently handle bats
- Persons with infrequent risk of infection, including veterinarians and animal control staff with terrestrial animals in areas where rabies infection is rare, veterinary students, travelers visiting areas where rabies is enzootic and immediate access to medical care and biologicals is limited

The ACIP recommends the use of postexposure vaccination for a particular person be assessed by the severity and likelihood versus the actual risk of acquiring rabies. Consideration should include the type of exposure, epidemiology of rabies in the area, species of the animal, circumstances of the incident, and the availability of the exposing animal for observation or rabies testing. Postexposure vaccination is used in both previously vaccinated and previously unvaccinated individuals.

Dosing: Adults

Pre-exposure vaccination: I.M.: 1 mL on days 0, 7, and 21 to 28.

Note: Prolonging the interval between doses does not interfere with immunity achieved after the concluding dose of the basic series.

Postexposure vaccination: All postexposure treatment should begin with immediate cleansing of the wound with soap and water

Persons not previously immunized as above: I.M.: 5 doses (1 mL each) on days 0, 3, 7, 14, 28. In addition, patients should receive rabies immune globulin with the first dose (day 0)

Persons who have previously received postexposure prophylaxis with rabies vaccine, received a recommended I.M. pre-exposure series of rabies vaccine or have a previously documented rabies antibody titer considered adequate: I.M.: Two doses (1 mL each) on days 0 and 3; do not administer rabies immune globulin

Booster (for persons with continuous or frequent risk of infection): I.M.: 1 mL based on antibody titers

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: I.M.For I.M. administration only; this rabies vaccine product must not be administered intradermally; in adults and children, administer I.M. injections in the deltoid muscle, not the gluteal; for younger children, use the outer aspect of the thigh.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

Rabies vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Rabies vaccine with live vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: Rabies vaccine may be given simultaneously at different sites or at any interval between doses. Examples of antibody containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StoragePrior to reconstitution, store under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light.
ReconstitutionReconstitute with provided diluent; gently swirl to dissolve. Use immediately after reconstitution.

Imovax®: Suspension will appear pink to red

RabAvert®: Suspension will appear clear to slightly opaque

Contraindications

Pre-exposure prophylaxis: Hypersensitivity to rabies vaccine or any component of the formulation

Postexposure prophylaxis: There are no contraindications listed within the FDA-approved manufacturer's labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use. Once postexposure prophylaxis has begun, administration should generally not be interrupted or discontinued due to local or mild adverse events. Continuation of vaccination following severe systemic reactions should consider the persons risk of developing rabies. Report serious reactions to the State Health Department or the manufacturer/distributor.

- Immune complex-like reactions: An immune complex reaction is possible 2-21 days following booster doses of HDCV. Symptoms may include arthralgia, arthritis, angioedema, fever, generalized urticaria, malaise, nausea, and vomiting.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

Dosage form specific issues:

- Imovax® Rabies: Contains albumin and neomycin.

- RabAvert®: Contains amphotericin B, bovine gelatin, chicken protein, chlortetracycline, and neomycin.

Other warnings/precautions:

- Appropriate use: Rabies: Rabies vaccine should not be used in persons with a confirmed diagnosis of rabies; use after the onset of symptoms may be detrimental. Postexposure vaccination may begin regardless of the length of time from documented or likely exposure, as long as clinical signs of rabies are not present.

Geriatric ConsiderationsNo specific data for use in the elderly. Use as recommended in elderly patients for whom this vaccine would be indicated.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Pregnancy is not a contraindication to postexposure prophylaxis. Pre-exposure prophylaxis during pregnancy may also be considered if risk of rabies is great.

LactationExcretion in breast milk unknown

Breast-Feeding ConsiderationsBreast-feeding mothers may be vaccinated.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%:

Central nervous system: Dizziness, headache, malaise

Gastrointestinal: Abdominal pain, nausea

Local: Erythema, itching, pain, swelling

Neuromuscular & skeletal: Myalgia

Miscellaneous: Lymphadenopathy

Uncommon, frequency not defined, postmarketing, and/or case reports:

Cardiovascular: Circulatory reactions, edema, palpitation

Central nervous system: Chills, fatigue, fever >38°C (100°F), Guillain-Barré syndrome, encephalitis, meningitis, multiple sclerosis, myelitis, neuroparalysis, vertigo

Dermatologic: Pruritus, urticaria, urticaria pigmentosa

Endocrine & metabolic: Hot flashes

Local: Limb swelling (extensive)

Neuromuscular & skeletal: Limb pain, monoarthritis, paralysis (transient), paresthesias (transient)

Otic: Retrobulbar neuritis, visual disturbances

Respiratory: Bronchospasm

Miscellaneous: Allergic reactions, anaphylaxis, hypersensitivity reactions, swollen lymph nodes

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Monitoring Parameters Monitor for syncope for ≥15 minutes following vaccination.

Antibody response to vaccination is not recommended for otherwise healthy persons who complete the pre-exposure or Postexposure regimen. Serologic testing to determine if the antibody titer is at an acceptable level is required for the following persons (booster vaccination recommended if titer is below the acceptable level):

Persons with continuous risk of infection: Serologic testing every 6 months

Persons with frequent risk of infection: Serologic testing every 2 years

Monitoring of antibody response to vaccination is not recommended for otherwise healthy persons who complete the pre-exposure or Postexposure regimen.

Reference Range Adequate adaptive immune response: antibody titers of 0.5 int. units/mL [WHO] or complete virus neutralization at a 1:5 serum dilution by the rapid fluorescent focus inhibition test (RFFIT) [ACIP]

Dosage Forms Injection, powder for reconstitution [preservative free]:

Imovax® Rabies: ≥2.5 int. units [HDCV; grown in human diploid cell culture; contains albumin (human), neomycin (may have trace amounts)]

RabAvert®: ≥2.5 int. units [contains albumin (human), amphotericin B (may have trace amounts), bovine gelatin, chicken egg protein, chlortetracycline (may have trace amounts), neomycin (may have trace amounts); PCEC; grown in chicken fibroblast culture]

Generic Available No

Pricing: U.S. (www.drugstore.com)

Suspension (reconstituted) (RabAvert)

(1): $250.99

Mechanism of Action Rabies vaccine is an inactivated virus vaccine which promotes immunity by inducing an active immune response. The production of specific antibodies requires about 7-10 days to develop. Rabies immune globulin or antirabies serum, equine (ARS) is given in conjunction with rabies vaccine to provide immune protection until an antibody response can occur.

Pharmacodynamics/Kinetics

Onset of action: I.M.: Rabies antibody: ~7-10 days

Peak effect: ~30-60 days

Duration: ≥1 year

Related Information

- Immunization Recommendations

Pharmacotherapy Pearls Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness and malaise

Mental Health: Effects on Psychiatric Treatment None reported

Mental Health Comment May cause neuroparalytic reactions and encephalomyelitis

Medication Safety Issues

Sound-alike/look-alike issues:

Evista® may be confused with Avinza™

Pronunciation(ral OKS i feen)

U.S. Brand NamesEvista®

Canadian Brand NamesEvista®

Pharmacologic CategorySelective Estrogen Receptor Modulator (SERM)

Use: Labeled IndicationsPrevention and treatment of osteoporosis in postmenopausal women; risk reduction for invasive breast cancer in postmenopausal women with osteoporosis and in postmenopausal women with high risk for invasive breast cancer

Dosing: Adults

Osteoporosis: Females: Oral: 60 mg/day

Invasive breast cancer risk reduction: Female: Oral: 60 mg/day for 5 years

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentChild-Pugh class A: Plasma concentrations were higher and correlated with total bilirubin. Safety and efficacy in hepatic insufficiency have not been established

Administration: OralMay be administered any time of the day without regard to meals.

Dietary ConsiderationsSupplemental calcium or vitamin D may be required if dietary intake is not adequate.

StorageStore between 15°C to 30°C (59°F to 86°F).

ContraindicationsHistory of or current venous thromboembolic disorders (including DVT, PE, and retinal vein thrombosis); pregnancy; breast-feeding

Warnings/Precautions

Boxed warnings:

- Cardiovascular disease: See “Disease-related concerns” below.
- Thromboembolic disease: See “Disease-related concerns” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: The risk of death due to stroke may be increased in women with coronary heart disease or in women at risk for coronary events;** use with caution in patients with cardiovascular disease. Do not use for the prevention of cardiovascular disease.
- Cervical/uterine carcinoma: Use with caution in patients with a history of cervical/uterine carcinoma.
- Hepatic impairment: Use with caution in patients with hepatic impairment; safety and efficacy have not been established.
- Lipid effects: Women with a history of elevated triglycerides in response to treatment with oral estrogens (or estrogen/progestin) may develop elevated triglycerides when treated with raloxifene; monitor.
- Renal impairment: Use with caution in patients with moderate-to-severe renal impairment; safety and efficacy have not been established.
- Thromboembolic disease: **[U.S. Boxed Warning]: May increase the risk for DVT or PE;** use with caution in patients at high risk for venous thromboembolism. Use contraindicated in patients with history of or current venous thromboembolic disorders. The risk for DVT and PE are higher in the first 4 months of treatment.
- Uterine bleeding: Use with caution in patients with unexplained uterine bleeding.

Concurrent drug therapy issues:

- Estrogens: Use with systemic estrogen therapy is not recommended; safety has not been established.

Special populations:

- Males: Safety and efficacy have not been established in men.

- Premenopausal women: Safety and efficacy have not been established in premenopausal women

Other warnings/precautions:

- Appropriate use: Not indicated for treatment of invasive breast cancer, to reduce the risk of recurrence of invasive breast cancer, or to reduce the risk of noninvasive breast cancer. The efficacy (for breast cancer risk reduction) in women with inherited BRCA1 and BRCA1 mutations has not been established.

- Prolonged immobilization: Discontinue at least 72 hours prior to and during prolonged immobilization (postoperative recovery or prolonged bedrest).

Geriatric ConsiderationsNo need to cycle with progesterone.

Pregnancy Risk FactorX

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity and fetal loss. There are no adequate and well-controlled studies in pregnant women. Raloxifene should not be used by pregnant women or by women planning to become pregnant in the immediate future.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions**Note:** Raloxifene has been associated with increased risk of thromboembolism (DVT, PE) and superficial thrombophlebitis; risk is similar to reported risk of HRT

>10%:

Cardiovascular: Peripheral edema (3% to 14%)

Endocrine & metabolic: Hot flashes (8% to 29%)

Neuromuscular & skeletal: Arthralgia (11% to 16%), leg cramps/muscle spasm (6% to 12%)

Miscellaneous: Flu syndrome (14% to 15%), infection (11% to 15%)

1% to 10%:

Cardiovascular: Chest pain (3% to 4%), syncope (2%), varicose vein (2%), venous thromboembolism (1% to 2%)

Central nervous system: Headache (9%), depression (6%), insomnia (6%), vertigo (4%), fever (3% to 4%), migraine (2%), hypoesthesia (≤2%)

Dermatologic: Rash (6%)

Endocrine & metabolic: Breast pain (4%)

Gastrointestinal: Nausea (8% to 9%), weight gain (9%), abdominal pain (7%), diarrhea (7%), dyspepsia (6%), vomiting (3% to 5%), flatulence (2% to 3%), cholelithiasis (≤3%), gastroenteritis (≤3%)

Genitourinary: Vaginal bleeding (6%), cystitis (3% to 5%), urinary tract infection (4%), vaginitis (4%), leukorrhea (3%), urinary tract disorder (3%), uterine disorder (3%), vaginal hemorrhage (3%), endometrial disorder (≤3%)

Neuromuscular & skeletal: Myalgia (8%), arthritis (4%), tendon disorder (4%), neuralgia (≤2%)

Ocular: Conjunctivitis (2%)

Respiratory: Bronchitis (10%), rhinitis (10%), sinusitis (8% to 10%), cough (6% to 9%), pharyngitis (5% to 8%), pneumonia (3%), laryngitis (≤2%)

Miscellaneous: Diaphoresis (3%)

<1%, postmarketing, and/or case reports: Apolipoprotein A1 increased, apolipoprotein B decreased, death related to VTE, fibrinogen decreased, hypertriglyceridemia (in women with a history of increased triglycerides in response to oral estrogens), intermittent claudication, LDL cholesterol decreased, lipoprotein decreased, muscle spasm, retinal vein occlusion, stroke related to VTE, superficial thrombophlebitis, total serum cholesterol decreased

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Raloxifene. *Risk D: Consider therapy modification*

Levothyroxine: Raloxifene may decrease the absorption of Levothyroxine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase risk of osteoporosis).

Monitoring ParametersBone mineral density (BMD), CBC, lipid profile; adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions. Evaluate results of laboratory test (lipid profile, BMD, CBC), effectiveness, and adverse response (eg, DVT, PE, chest pain, migraine, rash, hot flashes, vaginitis, UTI, myalgia, cough) on a regular basis during therapy. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, thromboembolism). **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. For use in postmenopausal women only.

Monitoring: Lab TestsMonitor lipid profile, bone mineral density (BMD), CBC

Patient EducationDo not take any new prescription, OTC medications, or herbal products during therapy without consulting prescriber. Avoid excessive use of alcohol (ethanol may increase risk of osteoporosis). May be taken at any time of day without regard to meals. Additional vitamin supplements may be recommended by your prescriber. May cause flu-like symptoms at beginning of therapy (these should resolve with use); GI disturbances (eg, nausea, vomiting, dyspepsia; small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or joint pain (consult prescriber for approved analgesic). Report immediately any pain, redness, warmth, or cramping in leg muscles; sudden chest pain; unusual cough or respiratory difficulty; or sudeen loss of consciousness or unusual weakness. Report persistent fever, acute migraine, insomnia or emotional depression, weight gain (>5 lb/week), unresolved gastric distress, urinary infection, or vaginal burning or itching. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. For use in postmenopausal women only. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride:

Evista®: 60 mg

Generic AvailableNo

ManufacturerEli Lilly and Co

Pricing: U.S. (www.drugstore.com)

Tablets (Evista)

60 mg (30): $107.89

Mechanism of ActionA selective estrogen receptor modulator (SERM), meaning that it affects some of the same receptors that estrogen does, but not all, and in some instances, it antagonizes or blocks estrogen; it acts like estrogen to prevent bone loss and has the potential to block some estrogen effects in the breast and uterine tissues. Raloxifene decreases bone resorption, increasing bone mineral density and decreasing fracture incidence.

Pharmacodynamics/Kinetics

Onset of action: 8 weeks

Absorption: Rapid; ~60%

Distribution: 2348 L/kg

Protein binding: >95% to albumin and α-glycoprotein; does not bind to sex-hormone-binding globulin

Metabolism: Hepatic, extensive first-pass effect; metabolized to glucuronide conjugates

Bioavailability: ~2%

Half-life elimination: 28-33 hours

Excretion: Primarily feces; urine (<0.2% as unchanged drug; <6% as glucuronide conjugates)

Pharmacotherapy PearlsThe decrease in estrogen-related adverse effects with the selective estrogen-receptor modulators in general and raloxifene in particular should improve compliance and decrease the incidence of cardiovascular events and fractures while not increasing breast cancer.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsKeoxifene Hydrochloride; NSC-706725; Raloxifene Hydrochloride

Raltegravir

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ral TEG ra vir)
U.S. Brand NamesIsentress™
Canadian Brand NamesIsentress™
Pharmacologic CategoryAntiretroviral Agent, Integrase Inhibitor
Use: Labeled IndicationsTreatment of HIV-1 infection in combination with other antiretroviral agents in treatment-experienced patients with virus that shows multidrug resistance and active replication
Dosing: Adults**HIV treatment:** Oral: 400 mg twice daily
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**HIV treatment:** Adolescents ≥16 years: Refer to adult dosing.
Dosing: Renal Impairment No dosage adjustment required in severe impairment.
Dosing: Hepatic ImpairmentNo dosage adjustment required with mild-to-moderate impairment. No data available in severe impairment.
Dietary ConsiderationsMay be taken with or without food.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
Contraindications

U.S. labeling: There are no contraindications listed in the manufacturer's labeling.

Canadian labeling: Hypersensitivity to raltegravir or any other component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Myopathy: Grade 2-4 creatine kinase (CK) increases have been observed and myopathy and rhabdomyolysis have been reported; use caution in patients with risk factors for CK elevations and/or skeletal muscle abnormalities.

Concurrent drug therapy issues:

- Potential for interactions: Use caution with medications known to induce (eg, rifampin) or inhibit (eg, atazanavir) UGT1A1 glucuronidation, as serum levels/therapeutic effects may be reduced or increased, respectively.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies revealed treatment-related increases in rib formation at 3-4 times human doses; no other embryo-/fetotoxic or teratogenic effects noted. There are no adequate and well-controlled studies in pregnant women and available data is insufficient to recommend use in pregnancy. An antiretroviral registry has been established to monitor maternal and fetal outcomes in women receiving antiretroviral drugs. Physicians are encouraged to register patients at 1-800-258-4263 or www.APRegistry.com.
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.
Adverse Reactions

>10%: Endocrine & metabolic: Total cholesterol increased (grade 2: 16%; grade 3: 6%)

2% to 10%:

Cardiovascular: Hypertension (3%)

Central nervous system: Fatigue (8%), dizziness (4%), insomnia (4%)

Dermatologic: Rash (5%), pruritus (3% to 4%), folliculitis (2%)

Endocrine & metabolic: Glucose increased (≤250 mg/dL: 9%), LDL-cholesterol increased (grade 2: 9%; grade 3: 4%), hypertriglyceridemia (grade 3: 4%)

Gastrointestinal: Abdominal pain (5%), vomiting (4%), amylase increased (2.1-5 x ULN: 4%), gastroenteritis (3%), lipase increased (1.6-3 x ULN: 3%), anorexia (2%), constipation (2%)

Hepatic: Hyperbilirubinemia (9%; 2.6-5 x ULN: 3%), AST increased (2.6-5 x ULN: 9%), ALT increased (5.1-10 x ULN: 3%), alkaline phosphatase increased (2.6-5 x ULN: 2%)

Neuromuscular & skeletal: Arthralgia (3%), extremity pain (3%), creatine kinase increased (all grades: 2%)

Renal: Creatinine increased (1.4-1.8 x ULN: 3%)

Respiratory: Nasopharyngitis (6%), cough (5%), influenza (3%), sinusitis (3%)

Miscellaneous: Herpes zoster (4%), lymphadenopathy (3%), anogenital warts (2%)

Frequency <2% or not defined: Acneiform dermatitis, allodynia, anemia, anxiety, appetite increased, asthenia, back pain, cellulitis, central obesity, chest discomfort, chills, depression, diabetes mellitus, dreams abnormal, drug hypersensitivity, dry skin, dyspepsia, dyslipidemia, epistaxis, erectile dysfunction, erythema, facial wasting, flatulence, neutropenia, fever, gastritis, GERD, glossitis, gynecomastia, headache, hepatitis, hepatomegaly, herpes simplex, hyperhidrosis, hyperlactacidemia, irritability, lipodystrophy, macrocytic anemia, maculopapular rash, MI, muscle atrophy, muscle spasms, myalgia, myositis, nephropathy, nephrotic syndrome, neuropathy, night sweats, nocturia, palpitation, paresthesia, pollakiuria, prurigo, renal failure, renal tubular necrosis, skin infection, somnolence, vertigo, ventricular extrasystoles, visual disturbance, weight changes

Postmarketing and/or case reports: Stevens-Johnson syndrome

Drug Interactions

Efavirenz: May decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Rifampin: May decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Tipranavir: May decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: High-fat meal increased AUC by 19%, but raltegravir was administered without regard to meals in clinical trials.

Herb/Nutraceutical: St John's wort may decrease the levels/effects of raltegravir.

Monitoring ParametersViral load, CD4 count, lipid profile

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological or herbal agents patient may be taking (eg, risk of toxicity, decreased effects). Evaluate results of laboratory tests at baseline and periodically (CD4 count and viral load). Evaluate therapeutic effectiveness (clinical and laboratory indicators) and adverse reactions during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsViral load, CD4 count, lipid profile

Patient EducationDo not take any new prescription, OTC medications, or herbal products during therapy unless approved by prescriber. This drug will not cure HIV, nor has it been found to reduce the transmission of HIV; use appropriate precautions to prevent spread of the disease. This drug may be prescribed as one part of a multidrug combination: Take exactly as directed for full course of therapy. If you miss a dose, take it as soon as you remember; do not double doses. You may be more susceptible to infection; avoid crowds and exposure to known infection. May cause dizziness, headache, or fatigue (use caution to avoid falls, when driving or when engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may reduce diarrhea); or itchy skin (if persistent, consult prescriber). Report signs of infection (unusual fever or chills, white plaques in mouth, vaginal itching or foul-smelling vaginal discharge, unusual cough, congestion, or unhealed wounds); muscle pain, tenderness, or weakness; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Isentress™: 400 mg

Generic AvailableNo

Manufacturer

Merck & Co, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Isentress)

400 mg (60): $953.01

Mechanism of ActionIncorporation of viral DNA into the host cell’s genome is required to produce a self-replicating provirus and propagation of infectious virion particles. The viral cDNA strand produced by reverse transcriptase is subsequently processed and inserted into the human genome by the enzyme HIV-1 integrase (encoded by the pol gene of HIV). Raltegravir inhibits the catalytic activity of integrase, thus preventing integration of the proviral gene into human DNA.

Pharmacodynamics/Kinetics

Absorption: AUC increased 19% with high-fat meal

Protein binding: ~83%

Metabolism: Primarily hepatic glucuronidation mediated by UGT1A1

Half-life elimination: ~9 hours

Time to peak, plasma: ~3 hours

Excretion: Feces (51%, as unchanged drug); urine (32%; 9% as unchanged drug)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Perinatal HIV Guidelines

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue, dizziness, or insomnia. Rarely associated with anxiety, depression, abnormal dreams, irritability, and somnolence.

Mental Health: Effects on Psychiatric TreatmentMay cause elevation in lipid panel; concomitant use with atypical antipsychotics may produce additive effects. St John's wort may decrease the serum levels/effects of raltegravir.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ral ti TREX ed)
Canadian Brand NamesTomudex®
Pharmacologic CategoryAntineoplastic Agent, Antimetabolite
Use: Labeled IndicationsTreatment of advanced colorectal neoplasms
Use: Unlabeled/InvestigationalUndergoing clinical trials for a variety of neoplasms, including breast, colorectal nonsmall cell lung, ovarian and pancreatic cancers
Dosing: AdultsRefer to individual protocols.

Colorectal cancer: I.V.: 3 mg/m^2 every 3 weeks

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment

Cl_{cr} 55-65 mL/minute: Administer 75% of dose every 4 weeks

Cl_{cr} 25-54 mL/minute: Administer % of dose equivalent to Cl_{cr} every 4 weeks (ie, 25% of dose for Cl_{cr} of 25 mL/minute)

Cl_{cr} <25 mL/minute: Do not administer

Dosing: Hepatic ImpairmentNo adjustment required for mild-moderate hepatic insufficiency. Patients who develop hepatic toxicity should have treatment held until returns to grade 2.
Dosing: Adjustment for Toxicity

Grade 4 gastrointestinal toxicity or grade 3 gastrointestinal toxicity in combination with grade 4 hematologic toxicity: Discontinue therapy

Grade 3 hematologic toxicity or grade 2 gastrointestinal toxicity: Reduce dose by 25%

Grade 4 hematologic toxicity or grade 3 gastrointestinal toxicity: Reduce dose by 50%

Calculations

- Body Surface Area: Adults
- Creatinine Clearance: Adults

Administration: I.V.Infuse over 15 minutes.
Dietary ConsiderationsAvoid folic acid, folinic acid, and multivitamins with folic acid close to and during administration.
StorageIntact vials should be refrigerated at 2°C to 25°C. Protect from light. Solutions reconstituted with saline or dextrose to a concentrate of 0.5 mg/mL are stable for up to 24 hours under refrigeration at 2°C to 8°C.
ReconstitutionReconstitute 2 mg vial with 4 mL SWFI; add to 50-250 mL NS or D_5W.
CompatibilityStable in D_5W, NS. Do not mix with other medications.
RestrictionsNot available in U.S./Investigational
ContraindicationsHypersensitivity to raltitrexed or any component of the formulation; uncontrolled diarrhea; severe renal or hepatic impairment; pregnancy or breast-feeding
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Malaise/weakness: Use with caution in patients with malaise/weakness; caution patients concerning operation of machinery/driving.

Disease-related concerns:

- Gastrointestinal disease: Use with caution in patients with a history of gastrointestinal problems (particularly diarrhea).

- Hepatic impairment: Use with caution in patients with mild-to-moderate hepatic impairment. Therapy interruption is required in patients with hepatotoxicity.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Chemotherapy: Use with caution in patients heavily pretreated with chemotherapy, especially if myelosuppression, stomatitis, hepatic or renal toxicities persist.

- Folic acid/folate-containing medications: Folinic acid, folic acid, or folate-containing medications (eg, multivitamins) may interfere with raltitrexed; do not administer immediately prior to or concurrently with raltitrexed.

Special populations:

- Elderly: Use with caution in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

- Radiation therapy recipients: Use with caution in patients heavily pretreated with radiation, especially if myelosuppression, stomatitis, hepatic or renal toxicities persist.

Pregnancy Risk FactorX

Pregnancy ConsiderationsExclude pregnancy prior to treatment with raltitrexed. Avoid pregnancy during treatment and for 6 months following treatment. Pregnant women should not handle this medication.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

>10%:

Central nervous system: Fever (2% to 23%), may be delayed until several days after administration

Dermatologic: Rashes (14%), usually pruritic papular lesions on head and thorax

Gastrointestinal: Nausea (58%; grade 3 or 4 in 12%), mucositis/stomatitis (12% to 48%; grade 3 or 4 in 2%), diarrhea (38%; grade 3 or 4 in 11%), vomiting (37%), anorexia (27%), abdominal pain (18%), constipation (13% to 15%; grade 3 or 4 in 2%)

Hematologic: Myelosuppression; leukopenia occurs in about 21% of patients (grade 3 or 4 in 12%), nadirs occur in ~8 days, but may be delayed to day 21, with recovery in ~10 days; thrombocytopenia (5% to 6%; grade 3 or 4 in 4%), anemia (15% to 18%; grade 3 or 4 in 7%)

Hepatic: Transaminases increased (14% to 18%; grade 3 or 4 in 10%)

Neuromuscular & skeletal: Weakness (46% to 48%; grade 3 or 4 in 9%)

1% to 10%:

Cardiovascular: Arrhythmias (3%), edema (9% to 10%), CHF (2%)

Central nervous system: Malaise, headache, pain, chills, insomnia, depression, paresthesia

Dermatologic: Alopecia, cellulitis, exfoliative eruptions

Endocrine & metabolic: Dehydration, hypokalemia

Gastrointestinal: Dyspepsia, flatulence, xerostomia, weight loss, taste perversion

Genitourinary: Urinary tract infection

Hepatic: Alkaline phosphatase increased, bilirubin increased

Neuromuscular & skeletal: Arthralgia, myalgia, hypotonia

Ocular: Conjunctivitis

Renal: Serum creatinine increased

Respiratory: Cough (increased), dyspnea, pharyngitis

Miscellaneous: Flu-like syndrome (6% to 8%), diaphoresis, infection, sepsis

<1%: Hypersensitivity/allergic reaction (including stridor and wheezing following the first dose), desquamation

Oncology: VesicantNo

Oncology: Emetic PotentialMild to moderate (30% to 60%)

Drug Interactions

Folic Acid: May diminish the therapeutic effect of Raltitrexed. *Risk X: Avoid combination*

Leucovorin-Levoleucovorin: May diminish the therapeutic effect of Raltitrexed. *Risk X: Avoid combination*

Methylfolate: May diminish the therapeutic effect of Raltitrexed. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid folic acid and multivitamins with folic acid close to and during administration.

Monitoring ParametersCBC with differential, hepatic function tests, serum lipids, serum creatinine

Monitoring: Lab TestsCBC with differential, hepatic function tests, serum lipids, serum creatinine

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as disodium: 2 mg

Generic AvailableNo
ManufacturerAstraZeneca (Canada)
Mechanism of ActionRaltitrexed is a folate analogue that inhibits thymidylate synthase, blocking purine synthesis. This results in an overall inhibition of DNA synthesis.
Pharmacodynamics/Kinetics

Distribution: V_{ss}: 548 L

Protein binding: 93%

Metabolism: Undergoes extensive intracellular metabolism to active polyglutamate forms; appears to be little or no systemic metabolism of the drug

Half-life elimination: Triphasic; Beta: 2 hours; Terminal: Up to 198 hours

Excretion: Urine (50% as unchanged drug); feces (15%)

Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause depression, insomnia, and malaise
Mental Health: Effects on Psychiatric TreatmentGI side effects are common; additive effects may be seen with SSRIs, lithium, and valproic acid derivatives. Myelosuppression is common; use caution with clozapine, carbamazepine, and valproic acid derivatives.
Mental Health Comment Flu-like syndrome may occur in up to 8% of individuals receiving this agent. Consider SSRI withdrawal syndrome in physician differential diagnosis.

Ramelteon

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ramelteon may be confused with Remeron®

Rozerem® may be confused with Razadyne™, Remeron®

Pronunciation(ra MEL tee on)

U.S. Brand NamesRozerem®

Pharmacologic CategoryHypnotic, Nonbenzodiazepine

Use: Labeled IndicationsTreatment of insomnia characterized by difficulty with sleep onset

Dosing: Adults**Insomnia:** Oral: One 8 mg tablet within 30 minutes of bedtime

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required

Dosing: Hepatic Impairment No adjustment required for mild-to-moderate impairment; use caution. Not recommended with severe impairment.

Administration: OralDo not administer with a high-fat meal. Swallow tablet whole; do not break.

Dietary ConsiderationsTaking with high-fat meal delays T_{max} and increases AUC (~31%); do not take with high-fat meal.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture.

RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHistory of angioedema with previous ramelteon therapy (do not rechallenge); concurrent use with fluvoxamine

Warnings/Precautions

Concerns related to adverse effects:

- Abnormal thinking/behavioral changes: Hypnotics/sedatives have been associated with abnormal thinking and behavior changes including decreased inhibition, aggression, bizarre behavior, agitation, hallucinations, and depersonalization. These changes may occur unpredictably and may indicate previously unrecognized psychiatric disorders; evaluate appropriately.

- CNS depression: May cause CNS depression impairing physical and mental capabilities; patients must be cautioned about performing tasks, which require mental alertness (operating machinery or driving).

- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents (including ramelteon) for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema. Do not rechallenge patients who have developed angioedema with ramelteon therapy.

- Reproductive hormonal regulation disturbances: May cause disturbances of reproductive hormonal regulation (eg, disruption of menses or decreased libido).

- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted.

Disease-related concerns:

- Depression: Use with caution in patients with depression; worsening of depression, including suicidal ideation has been reported with the use of hypnotics.

- Hepatic impairment: Use with caution in patients with hepatic impairment; use not recommended with severe impairment.

- Respiratory disease: Use with caution in patients with respiratory compromise, COPD or sleep apnea.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

- CYP1A2 inhibitors: Use with caution when administered concomitantly with strong CYP1A2 inhibitors.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Symptomatic treatment of insomnia should be initiated only after careful evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after a reasonable period of treatment may indicate psychiatric and/or medical illness.

- Rapid onset: Because of the rapid onset of action, administer immediately prior to bedtime or after the patient has gone to bed and is having difficulty falling asleep.

Geriatric ConsiderationsAlthough the C_{max} and AUC of ramelteon were increased in elderly patients, in clinical trials there were no significant differences in safety or efficacy between elderly and younger adult subjects.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have demonstrated teratogenic effects. May cause disturbances of reproductive hormonal regulation (eg, disruption of menses or decreased libido). There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions 1% to 10%:

Central nervous system: Dizziness (4% to 5%), somnolence (3% to 5%), fatigue (3% to 4%), insomnia worsened (3%), depression (2%)

Endocrine & metabolic: Serum cortisol decreased (1%)

Gastrointestinal: Nausea (3%), taste perversion (2%)

Neuromuscular & skeletal: Myalgia (2%), arthralgia (2%)

Respiratory: Upper respiratory infection (3%)

Miscellaneous: Influenza (1%)

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls), prolactin levels increased, testosterone levels decreased

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), CYP3A4 (minor), CYP2C family (minor)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Fluconazole: May decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Fluvoxamine: May decrease the metabolism of Ramelteon. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Taking with high-fat meal delays T_{max} and increases AUC (~31%); do not take with high-fat meal.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions. Be alert to possibility of anaphylaxis any time during therapy. Monitor for CNS changes, abnormal thinking, and behavior changes. Assess effectiveness and interactions of other medications patient may be taking. Assess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report.
Patient EducationTake approximately 30 minutes before desiring to go to sleep. Avoid alcohol and other CNS depressants. You may experience dizziness or lightheadedness (use caution when driving or engaging in activities requiring alertness until response to drug is known), or headache. Avoid meal high in fat prior to taking this medication. Report abnormal thinking or behavior; unusual swelling, especially on face or neck; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Rozerem®: 8 mg

Generic AvailableNo
ManufacturerTakeda Pharmaceuticals Co, Ltd
Pricing: U.S. (www.drugstore.com)

Tablets (Rozerem)

8 mg (30): $120.89

Mechanism of ActionPotent, selective agonist of melatonin receptors MT_1 and MT_2 (with little affinity for MT_3) within the suprachiasmic nucleus of the hypothalamus, an area responsible for determination of circadian rhythms and synchronization of the sleep-wake cycle. Agonism of MT_1 is thought to preferentially induce sleepiness, while MT_2 receptor activation preferentially influences regulation of circadian rhythms. Ramelteon is eightfold more selective for MT_1 than MT_2 and exhibits nearly sixfold higher affinity for MT_1 than melatonin, presumably allowing for enhanced effects on sleep induction.

Pharmacodynamics/Kinetics

Onset of action: 30 minutes

Absorption: Rapid; high-fat meal delays T_{max} and increases AUC (~31%)

Distribution: 74 L

Protein binding: ~82%

Metabolism: Extensive first-pass effect; oxidative metabolism primarily through CYP1A2 and to a lesser extent through CYP2C and CYP3A4; forms active metabolite (M-II)

Bioavailability: Absolute: 1.8%

Half-life elimination: Ramelteon: 1-2.6 hours; M-II: 2-5 hours

Time to peak, plasma: Median: 0.5-1.5 hours

Excretion: Primarily as metabolites: Urine (84%); feces (4%)

- Nonbenzodiazepine Anxiolytics and Hypnotics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

Ramipril and Felodipine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(RA mi pril & fe LOE di peen)

Canadian Brand NamesAltace® Plus Felodipine

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Calcium Channel Blocker

Use: Labeled IndicationsTreatment of hypertension when combination therapy is appropriate (not for initial therapy)

Dosing: Adults**Note:** Not for initial therapy; titration of individual agents to an appropriate clinical response is required before patient is converted over to an equivalent dose of the combination product.

Hypertension (dose is individualized): Oral: Ramipril 2.5-10 mg and felodipine ER 2.5-10 mg once daily; adjust dose no more frequently than every 2 weeks

Dosing: ElderlyInitial: 2.5 mg daily based on felodipine ER component

Dosing: Renal ImpairmentDose reduction required. See individual agents. Maximum dosage: 5 mg/day based on ramipril component.

Dosing: Hepatic ImpairmentDose reduction required. See individual agents. Maximum dosage: 10 mg/day based on felodipine ER component.

Administration: OralSwallow tablet whole; tablet should not be divided, crushed, or chewed

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from moisture.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to felodipine or other dihydropyridines, ramipril or other ACE inhibitors, or any other component of the formulation; history of angioedema; pregnancy; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: With initiation or dosage titration of dihydropyridine calcium channel blockers, reflex tachycardia may occur resulting in angina and/or MI in patients with obstructive coronary disease especially in the absence of concurrent beta-blockade.

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors. It may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Gingival hyperplasia: Gingival hyperplasia may be induced by felodipine in patients with gingivitis and periodontitis. Effects may be reversed with good oral hygiene and mechanical debridement of teeth.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial ding and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Peripheral edema: The most common side effect of felodipine (dose dependent) is peripheral edema; occurs within 2-3 weeks of starting therapy.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation of therapy; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with extreme caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.
- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.
- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.
- Heart failure: Use with caution. Safety and efficacy has not been established in patients with heart failure.
- Hepatic impairment: Use with caution in patients with hepatic impairment; ACEI therapy has been associated with hepatitis, and elevated hepatic enzymes and bilirubin; lower starting dose may be necessary; evaluate hepatic function at baseline before initiating therapy and closely monitor thereafter.
- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.
- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Elderly: Initiate therapy at a lower dose in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Use is contraindicated in pregnancy. Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. Women of child bearing potential should employ a reliable means of contraception. ACEIs should be discontinued as soon as possible once pregnancy is detected.

Other warnings/precautions:

- Appropriate use: Used as a replacement for separate dosing of components or combination therapy when response to single agent is suboptimal; the fixed combination is not indicated for initial treatment of hypertension.
- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous rennin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy ConsiderationsUse is contraindicated in pregnancy. See individual agents.
LactationExcretion of felodipine and ramipril into breast milk unknown/contraindicated
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsIncidence observed with combination product. Also see individual agents.

1% to 10%:

Cardiovascular: Vasodilation (3%), peripheral edema (2%), palpitation (1%)

Central nervous system: Headache (8%), dizziness (3%), vertigo (2%)

Gastrointestinal: Nausea (2%), abdominal pain (1%), diarrhea (1%)

Neuromuscular & skeletal: Back pain (2%), weakness (2%)

Respiratory: Cough (6%), bronchitis (3%), upper respiratory infection (1%)

Miscellaneous: Flu-like syndrome (2%)

<1%: Angina pectoris, anorexia, anxiety, arrhythmia, arthralgia, arthritis, arthrosis, bilirubin increased, blurred vision, bronchospasm, cerebrovascular accident, colitis, constipation, cystitis, depression, diabetes mellitus, diaphoresis, dyspepsia, dyspnea, dysuria, ECG abnormal, edema, enteritis, epistaxis, extrasystoles, facial edema, fever, flatulence, gastritis, gastroenteritis, gout, heaviness in extremities, hemiplegia, hemoglobin decreased, hepatic enzymes increased, hydronephrosis, hypesthesia, insomnia, joint disorder, laryngitis, libido decreased, liver fatty deposit, MI, migraine, pain, muscle cramps, myalgia, nervousness, paresthesia, peripheral vascular disorder, pharyngitis, polyuria, postural hypotension, pruritus, pulmonary embolism, pyelonephritis, rash, retinal disorder, rhinitis, shock, sinus bradycardia, sinusitis, somnolence, tachycardia, tinnitus, T-wave inverted, urinary tract infection, urticaria, vomiting, xerostomia

Metabolism/Transport EffectsSee individual agents.
Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring Parameters Blood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/Monitoring See individual agents.

Monitoring: Lab Tests Serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient Education See individual agents.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet, variable release:

Altace® Plus Felodipine 2.5/2.5 [CAN]: Ramipril 2.5 mg [immediate release] and felodipine 2.5 mg [extended release] [not available in the U.S.]

Altace® Plus Felodipine 5/5 [CAN]: Ramipril 5 mg [immediate release] and felodipine 5 mg [extended release] [not available in the U.S.]

Generic Available No

Manufacturer Sanofi-Aventis Canada Inc

Mechanism of Action

Ramipril is an ACE inhibitor which first undergoes enzymatic saponification by esterases in the liver, to its active metabolite ramiprilat. The pharmacodynamic effects of ramipril result from the high-affinity, competitive, reversible binding of ramiprilat to angiotensin-converting enzyme thus preventing the formation of the potent vasoconstrictor angiotensin II from angiotensin I. This isomerized enzyme-inhibitor complex has a slow rate of dissociation, which results in high potency and a long duration of action; a CNS mechanism may also be involved in the hypotensive effect as angiotensin II increases adrenergic outflow from CNS; vasoactive kallikreins may be decreased in conversion to active hormones by ACE inhibitors, thus reducing blood pressure

Felodipine inhibits calcium ions from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation, increases myocardial oxygen delivery in patients with vasospastic angina.

Pharmacodynamics/Kinetics See individual agents.

Medication Safety Issues

Sound-alike/look-alike issues:

Altace® HCT may be confused with alteplase, Artane®, Altace®

Pronunciation(RA mi pril & hye droe klor oh THYE a zide)

Canadian Brand NamesAltace® HCT

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of essential hypertension (not for initial therapy)

Dosing: Adults**Hypertension:** Oral: **Note:** Not for initial therapy; titration of individual agents to an appropriate clinical response is required before patient is converted over to an equivalent dose of the combination product.

Usual dosage: Ramipril 2.5 mg/hydrochlorothiazide 12.5 mg once daily; titrate to maximum ramipril 10 mg/hydrochlorothiazide 50 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-60 mL/minute: Use caution; maximum dose: Ramipril 5 mg/hydrochlorothiazide 25 mg once daily

Cl_{cr} <30 mL/minute: Hydrochlorothiazide is usually ineffective

Dosing: Hepatic ImpairmentNo specific dosing available.

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister without regard to meals.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to ramipril, hydrochlorothiazide, other ACE inhibitors or thiazides, sulfonamide-derived drugs, or any other component of the formulation; angioedema related to previous treatment with an ACE inhibitor; patients with idiopathic or hereditary angioedema; anuria; pregnancy; breast-feeding

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs. Consider discontinuing therapy if symptoms of hepatic dysfunction (eg, fever, malaise, muscle pain, rash) present within the first weeks to months of therapy.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with bone marrow suppression including rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hyperplasia. Patients with collagen vascular disease (eg, systemic lupus erythematosus) and/or renal disease are at a higher risk of developing bone marrow suppression. Monitor CBC with differential in these patients.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use ACE inhibitors with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide may cause systemic lupus erythematosus (SLE) exacerbation or activation.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction. In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use ramipril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use ACE inhibitors with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Patients with renal impairment may be at increased risk for hematologic toxicity. Avoid hydrochlorothiazide in severe renal disease (ineffective). Contraindicated in patients with anuria.

Special populations:

- Pediatrics: Safety and efficacy of ramipril/hydrochlorothiazide have not been established in children.

- Pregnancy: **[Canadian Boxed Warning]: ACEIs can cause injury and death to the developing fetus when used in pregnancy. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsSee individual agents.
Pregnancy ConsiderationsUse is contraindicated. See individual agents.
LactationEnters breast milk/contraindicated
Breast-Feeding ConsiderationsSee individual agents.
Adverse Reactions**Note:** Observed with ramipril/hydrochlorothiazide. Also see individual agents.

1% to 10%:

Central nervous system: Headache (4%), dizziness (2%)

Neuromuscular & skeletal: Neuralgia (2%), back pain (1%), weakness (1%)

Respiratory: Bronchitis (2%), cough increased (1%), upper respiratory infection (1%)

Miscellaneous: Infection (2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acute liver failure, acute renal failure, agranulocytosis, allergic reactions, alopecia, anaphylactoid reaction, angina, angioedema, anxiety, apathy, arrhythmia, arthralgia, auditory disturbance, bilirubin increased, bone marrow depression, bronchospasm, BUN increased, confusion, constipation, conjunctivitis, creatinine (serum) increased, depression, diaphoresis, diarrhea, drowsiness, dry (nonproductive) cough, dyspnea, enanthema, eosinophilia, erythema multiforme, exanthema, exfoliative dermatitis, fever, gastroenteritis, gastrointestinal pain, glossitis, gout, hemolytic anemia, hot flushes, hypercalcemia, hypercholesterolemia hyperglycemia, hyper-/hypokalemia, hypertriglyceridemia, hyperuricemia, hypochloremia, hypomagnesemia, hyponatremia, hypotension, impotence, interstitial nephritis, ischemic stroke, jaundice, leukopenia, libido decreased, liver function test abnormalities, maculopapular rash, magnesium increased (serum), metabolic alkalosis, MI, muscle cramps, myalgia, nausea, nervousness, orthostatic hypotension, palpitation, pancreatitis, pancytopenia, paresthesia, pemphigus, peripheral edema, photosensitivity, polydipsia, postural hypotension, pruritus, psoriasis, rash, renal failure, restlessness, shock, sinusitis, sleep disorder, smell disturbance, somnolence, Stevens-Johnson syndrome, syncope, tachycardia, taste disturbance, thrombocytopenia, toxic epidermal necrolysis, tinnitus, tremor, transaminases increased, urticaria, vasculitis, visual disturbances, vomiting, xerostomia

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions See individual agents.
Monitoring Parameters Blood pressure; BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential
Nursing: Physical Assessment/Monitoring See individual agents.
Monitoring: Lab Tests BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential
Patient Education See individual agents.
Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Altace® HCT 2.5/12.5 [CAN]: Ramipril 2.5 mg and hydrochlorothiazide 12.5 mg [not available in the U.S.]

Altace® HCT 5/12.5 [CAN]: Ramipril 5 mg and hydrochlorothiazide 12.5 mg [not available in the U.S.]

Altace® HCT 5/25 [CAN]: Ramipril 5 mg and hydrochlorothiazide 25 mg [not available in the U.S.]

Altace® HCT 10/12.5 [CAN]: Ramipril 10 mg and hydrochlorothiazide 12.5 mg [not available in the U.S.]

Altace® HCT 10/25 [CAN]: Ramipril 10 mg and hydrochlorothiazide 25 mg [not available in the U.S.]

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ramipril may be confused with enalapril, Monopril®

Altace® may be confused with alteplase, Amaryl®, Amerge®, Artane®

International issues:

Altace® may be confused with Altace® HCT which is a brand name for ramipril/hydrochlorothiazide combination product in Canada

Pronunciation(RA mi pril)

U.S. Brand NamesAltace®

Canadian Brand NamesAltace®; Apo-Ramipril®; CO Ramipril; GEN-Ramipril; Novo-Ramipril; RAN-Ramipril; ratio-Ramipril; Sandoz-Ramipril

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension, alone or in combination with thiazide diuretics; treatment of left ventricular dysfunction after MI; to reduce risk of MI, stroke, and death in patients at increased risk for these events

Use: Unlabeled/InvestigationalTreatment of heart failure; to delay the progression of nephropathy and reduce risks of cardiovascular events in hypertensive patients with type 1 or 2 diabetes mellitus

Dosing: Adults

Hypertension: Oral: 2.5-5 mg once daily, maximum: 20 mg/day

To reduce the risk of MI, stroke, and death from cardiovascular causes: Oral: Initial: 2.5 mg once daily for 1 week, then 5 mg once daily for the next 3 weeks, then increase as tolerated to 10 mg once daily (may be given as divided dose)

Left ventricular dysfunction postmyocardial infarction: Oral: Initial: 2.5 mg twice daily titrated upward, if possible, to 5 mg twice daily.

Heart failure (unlabeled use): Initial: 1.25-2.5 mg once daily; target dose: 10 mg once daily (ACC/AHA 2005 Heart Failure Guidelines)

Note: The dose of any concomitant diuretic should be reduced. If the diuretic cannot be discontinued, initiate therapy with 1.25 mg. After the initial dose, the patient should be monitored carefully until blood pressure has stabilized.

Dosing: ElderlyRefer to adult dosing (see Geriatric Considerations). Adjust for renal function for elderly since glomerular filtration rates are decreased; may see exaggerated hypotensive effects if renal clearance is not considered.

Dosing: Renal Impairment

Cl_{cr} <40 mL/minute: Administer 25% of normal dose.

Renal failure and hypertension: Administer 1.25 mg once daily, titrated upward as possible.

Renal failure and heart failure: Administer 1.25 mg once daily, increasing to 1.25 mg twice daily up to 2.5 mg twice daily as tolerated.

Calculations

- Creatinine Clearance: Adults

Administration: OralCapsule is usually swallowed whole, but may be may be mixed in water, apple juice, or applesauce.

StorageStore at controlled room temperature.

ContraindicationsHypersensitivity to ramipril or any component of the formulation; prior hypersensitivity (including angioedema) to ACE inhibitors

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.
- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.
- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.
- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.
- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.
- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.
- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.
- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.
- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.
- Renal artery stenosis: Use ramipril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsDue to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with CHF and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in the elderly and causes little or no CNS confusion; use lowest dose recommendations initially. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, ramipril is considered pregnancy category C during the first trimester. Based on human data, ramipril is considered pregnancy category D if used during the second and third trimesters (per the manufacturer; however, one study suggests that fetal injury may occur at anytime during pregnancy). Ramipril crosses the placenta. First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

Lactation Excretion in breast milk unknown/not recommended

Breast-Feeding Considerations Ramipril and its metabolites were not detected in breast milk following a single oral dose of 10 mg. It is not known if multiple doses will produce detectable levels. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Ramipril in Pregnancy & Lactation

Adverse Reactions **Note:** Frequency ranges include data from hypertension and heart failure trials. Higher rates of adverse reactions have generally been noted in patients with CHF. However, the frequency of adverse effects associated with placebo is also increased in this population.

>10%: Respiratory: Cough (increased) (7% to 12%)

1% to 10%:

Cardiovascular: Hypotension (11%), angina (up to 3%), postural hypotension (2%), syncope (up to 2%)

Central nervous system: Headache (1% to 5%), dizziness (2% to 4%), fatigue (2%), vertigo (up to 2%)

Endocrine & metabolic: Hyperkalemia (1% to 10%)

Gastrointestinal: Nausea/vomiting (1% to 2%)

Neuromuscular & skeletal: Chest pain (noncardiac) (1%)

Renal: Renal dysfunction (1%), serum creatinine increased (1% to 2%), BUN increased (<1% to 3%); transient increases of creatinine and/or BUN may occur more frequently

Respiratory: Cough (estimated 1% to 10%)

<1%: Agranulocytosis, abdominal pain, amnesia, anaphylactoid reaction, angioedema, anorexia, anxiety, arrhythmia, arthralgia, arthritis, bone marrow depression, cerebrovascular events, constipation, convulsions, decreased hematocrit, decreased hemoglobin, depression, diarrhea, dyspepsia, dysphagia, dyspnea, edema, eosinophilia, epistaxis, erythema multiforme, gastroenteritis, hearing loss, hemolytic anemia, hepatitis, hypersensitivity reactions (fever, rash, urticaria), hyponatremia, impotence, increased diaphoresis, increased salivation, insomnia, malaise, myalgia, MI, nervousness, neuralgia, neuropathy, onycholysis, palpitation, pancreatitis, pancytopenia, paresthesia, pemphigoid, pemphigus, photosensitivity, proteinuria, purpura, somnolence, Stevens-Johnson syndrome, symptomatic hypotension, taste disturbance, thrombocytopenia, tinnitus, toxic epidermal necrolysis, transaminases increased, tremor, vision disturbances, weight gain, xerostomia

Postmarketing and/or case reports: Agitation

Worsening of renal function may occur in patients with bilateral renal artery stenosis or in hypovolemia. In addition, a syndrome which may include fever, myalgia, arthralgia, interstitial nephritis, vasculitis, rash, eosinophilia and positive ANA, and elevated ESR has been reported with ACE inhibitors. Risk of pancreatitis and agranulocytosis may be increased in patients with collagen vascular disease or renal impairment.

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Test InteractionsIncreases BUN, creatinine, potassium, positive Coombs' [direct]; decreases cholesterol (S); may cause false-positive results in urine acetone determinations using sodium nitroprusside reagent

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringEvaluate carefully for necessary use cautions. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact fluid balance or cardiac status). May be advisable to administer first dose in prescriber's office with careful blood pressure monitoring (hypotension or angioedema can occur at any time during treatment, especially following first dose). Assess results of laboratory tests, therapeutic effectiveness (blood pressure and cardiac status), and adverse response (eg, cough, renal dysfunction, nausea/vomiting, hypovolemia, angioedema, postural hypotension) on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take as directed; do not alter dose or discontinue without consulting prescriber. Take first dose at bedtime or when sitting down (hypotension may occur). This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause increased cough (if persistent or bothersome, contact prescriber); headache (consult prescriber for approved analgesic); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Immediately report swelling of face, mouth, lips, tongue or throat; chest pain or irregular heartbeat. Report respiratory difficulty or persistent cough; persistent pain in muscles, joints, or back; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 1.25 mg, 2.5 mg, 5 mg, 10 mg

Altace®: 1.25 mg, 2.5 mg, 5 mg, 10 mg

Tablet:

Altace®: 1.25 mg, 2.5 mg, 5 mg, 10 mg

Generic AvailableYes: Capsule

ManufacturerMonarch Pharmaceuticals
Pricing: U.S. (www.drugstore.com)

Capsules (Altace)

- 1.25 mg (30): $57.11
- 2.5 mg (30): $64.99
- 5 mg (30): $65.99
- 10 mg (30): $76.99

Capsules (Ramipril)

- 1.25 mg (100): $139.99
- 2.5 mg (30): $49.99
- 5 mg (30): $55.99
- 10 mg (30): $61.99

Mechanism of ActionRamipril is an ACE inhibitor which prevents the formation of angiotensin II from angiotensin I and exhibits pharmacologic effects that are similar to captopril. Ramipril must undergo enzymatic saponification by esterases in the liver to its biologically active metabolite, ramiprilat. The pharmacodynamic effects of ramipril result from the high-affinity, competitive, reversible binding of ramiprilat to angiotensin-converting enzyme, thus preventing the formation of the potent vasoconstrictor angiotensin II. This isomerized enzyme-inhibitor complex has a slow rate of dissociation, which results in high potency and a long duration of action; a CNS mechanism may also be involved in the hypotensive effect as angiotensin II increases adrenergic outflow from CNS; vasoactive kallikreins may be decreased in conversion to active hormones by ACE inhibitors, thus reducing blood pressure

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Duration: 24 hours

Absorption: Well absorbed (50% to 60%)

Distribution: Plasma levels decline in a triphasic fashion; rapid decline is a distribution phase to peripheral compartment, plasma protein and tissue ACE (half-life: 2-4 hours); second phase is an apparent elimination phase representing the clearance of free ramiprilat (half-life: 9-18 hours); and final phase is the terminal elimination phase representing the equilibrium phase between tissue binding and dissociation

Protein binding:

- Ramipril: 73%
- Ramiprilat: 56%

Metabolism: Hepatic to the active form, ramiprilat

Bioavailability:

- Ramipril: 28%
- Ramiprilat: 44%

Half-life elimination: Ramiprilat: Effective: 13-17 hours; Terminal: >50 hours

Time to peak, serum:

- Ramipril: ~1 hour
- Ramiprilat: 2-4 hours

Excretion: Urine (60%) and feces (40%) as parent drug and metabolites

Related Information

- Angiotensin Agents
- Heart Failure (Systolic)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness; may rarely cause nervousness, amnesia, insomnia, or depression
Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels
Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, or history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after four years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Anesthesia and Critical Care Concerns/Other ConsiderationsA recently completed trial (HOPE), examining the use of ramipril (at a dose of between 2.5-10 mg daily) in patients at high risk for cardiovascular events but who did not have heart failure, documented a significant improvement in cardiovascular outcome in the treated group.

ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. ACE inhibitors are also indicated in patients postmyocardial infarction in whom left ventricular ejection fraction is <40%.

ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Ranibizumab

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ra ni BIZ oo mab)
U.S. Brand NamesLucentis®
Canadian Brand NamesLucentis®
Pharmacologic CategoryAngiogenesis Inhibitor; Monoclonal Antibody; Ophthalmic Agent; Vascular Endothelial Growth Factor (VEGF) Inhibitor
Use: Labeled IndicationsTreatment of neovascular (wet) age-related macular degeneration (AMD)
Dosing: Adults

Age-related macular degeneration (AMD): Intravitreal injection: 0.5 mg (0.05 mL) once a month. **Note:** Frequency may be reduced after the first 4 injections to once every 3 months if monthly injections are not feasible; however, this regimen has reportedly resulted in a ~5 letter (1 line) loss of visual acuity over 9 months, as compared to monthly dosing. Dosing every 3 months will lead to an ~5 letter (1 line) loss of visual acuity over 9 months, as compared to monthly dosing.

Canadian labeling: AMD: Intravitreal injection: 0.5 mg (0.05 mL) once a month. Frequency may be reduced after the first 3 injections to once every 3 months if monthly injections are not feasible.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentDose adjustment not expected.
Dosing: Hepatic ImpairmentDose adjustment not expected.
Administration: OtherFor ophthalmic intravitreal injection only. Remove contents from vial using a 5 micron 19-gauge filter needle attached to a tuberculin syringe. Discard filter needle and replace with a sterile 30 gauge $^{1}/_{2}$ inch needle for injection. Adequate anesthesia and a broad-spectrum antimicrobial agent should be administered prior to the procedure.
StorageStore in original carton under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light. Do not freeze.
ContraindicationsHypersensitivity to ranibizumab or any component of the formulation; ocular or periocular infection

Canadian labeling: Additional contraindications: Active intraocular inflammation

Warnings/Precautions

Concerns related to adverse effects:

- Endophthalmitis/retinal detachment: Intravitreous injections may be associated with endophthalmitis and retinal detachments. Proper aseptic injection techniques should be used and patients should be instructed to report any signs of infection immediately.

- Hypersensitivity reactions: Hypersensitivity may present as severe intraocular inflammation. Rare hypersensitivity reactions (including anaphylaxis) have been associated with another VEGF inhibitor, pegaptanib, occurring within several hours of use; monitor closely. Equipment and appropriate personnel should be available for monitoring and treatment of anaphylaxis.

- Increased intraocular pressure: Following intravitreal injection, intraocular pressure may increase. Onset is seen within 60 minutes.

- Thromboembolic events: Risk of thromboembolic events, particularly stroke, may be increased following intravitreal administration of VEGF inhibitors.

- Visual disturbances: Intravitreal injections of ranibizumab may induce temporary visual disturbances that impair the ability to drive or operate machinery. Affected patients should be advised to abstain from driving or using machinery until resolution of visual disturbances.

Special populations:

- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.

Other warnings/precautions:

- Concurrent therapy (Canadian labeling): Safety and efficacy of ranibizumab administered concurrently to both eyes or in recipients of previous intravitreal injections has not been established.

- Duration of therapy: Use for >24 months has not been evaluated.

Geriatric ConsiderationsIn clinical trials, ~94% of the patients were >65 years and 68% were >75 years of age. No differences were seen in efficacy with increasing age. After correcting for creatinine clearance, age did not affect systemic exposure of ranibizumab.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions**Note:** Rates of ocular adverse reactions reported for control group when percentages overlapped with treatment group.

>10%:

Central nervous system: Headache (2% to 15%)

Neuromuscular & skeletal: Arthralgia (3% to 11%)

Ocular: Conjunctival hemorrhage (43% to 77%; control: 29% to 66%), eye pain (17% to 37%; control 11% to 33%), vitreous floaters (3% to 32%), intraocular pressure increased (8% to 24%), vitreous detachment (7% to 22%; control 13% to 18%), intraocular inflammation (5% to 18%; control 3% to 11%), eye irritation (4% to 19%; control 6% to 20%), visual disturbance (up to 14%), blepharitis (3% to 13%), retinal disorder (≤13%), retinal degeneration (1% to 11%)

Note: Cataract, foreign body sensation, lacrimation increased, pruritus, and subretinal fibrosis occurred in >10% of patients, but also occurred in similar percentages to the control; visual acuity blurred/decreased occurred more often in the control.

Respiratory: Nasopharyngitis (5% to 16%), upper respiratory tract infection (2% to 15%)

1% to 10%:

Cardiovascular: Arterial thromboembolic events (≤5%; stroke ≤3%), atrial fibrillation (≤5%)

Endocrine & metabolic: Hypercholesterolemia (1% to 8%), diabetes mellitus (≤5%)

Gastrointestinal: Nausea (2% to 9%), viral gastroenteritis ≤5%)

Hematologic: Anemia (3% to 8%; control up to 8%)

Ocular: Conjunctival hyperemia (≤9%), posterior capsule opacification (≤8%), injection site hemorrhage (≤5%), vitreous hemorrhage (≤4%)

Note: Ocular hyperemia, maculopathy, dry eye, and ocular discomfort occurred in 1% to 10% of patients, but also occurred in similar percentages to the control; retinal exudates occurred more often in the control.

Respiratory: Bronchitis (3% to 10%), cough (3% to 10%), sinusitis (2% to 8%), chronic obstructive pulmonary disease (COPD) (≤5%), dyspnea (≤5%)

Miscellaneous: Influenza (2% to 10%), ranibizumab antibodies (1% to 6%), herpes zoster (≤5%)

<1%: Endophthalmitis, iatrogenic traumatic cataracts, retinal tear, rhegmatogenous retinal detachments

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersIntraocular pressure (within 30 minutes and between 2-7 days following administration); retinal perfusion, endophthalmitis

Nursing: Physical Assessment/MonitoringFor ophthalmic intravitreal injection only under controlled aseptic conditions with adequate anesthesia and broad-spectrum antimicrobial agent administered before hand. Patient should be monitored closely at time of injection and for several hours after injections for hypersensitivity reaction (treatment for anaphylactic reaction should be immediately available), for elevation in intraocular pressure and for endophthalmitis. Assess therapeutic effectiveness, and adverse reactions (eg. thromboembolic events, endophthalmitis) on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication can only be administered by injection. You will be monitored closely during and following injection procedure. Report immediately any acute eye pain, difficulty breathing or swallowing, chest pain, heart palpitations, or other acute reactions. In the days following injection, you may experience headache (consult prescriber for approved analgesic); mild cough; flu symptoms (consult prescriber if persistent); foreign body sensation; and increased tearing or visual blurring (use caution when driving or engaged in potentially hazardous tasks). Report immediately if your eye becomes red, painful, swollen, sensitive to light, or if there is a change in your vision; report any other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian product availability

Injection, solution [preservative free]:

Lucentis®: 10 mg/mL (0.2 mL)

Lucentis® [CAN]: 10 mg/mL (0.3 mL)

Generic AvailableNo

ManufacturerGenentech, Inc

Mechanism of ActionRanibizumab is a recombinant humanized monoclonal antibody fragment which binds to and inhibits human vascular endothelial growth factor A (VEGF-A). Ranibizumab inhibits VEGF from binding to its receptors and thereby suppressing neovascularization and slowing vision loss.

Pharmacodynamics/Kinetics

Absorption: Low levels are detected in the serum following intravitreal injection

Half-life elimination: Vitreous: ~9 days

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Canadian Brand NamesAcid Reducer; Acid Reducer Maximum Strength Non Prescription; Alti-Ranitidine; Apo-Ranitidine®; BCI-Ranitidine; CO Ranitidine; Dom-Ranitidine; Gen-Ranidine; Novo-Ranidine; Nu-Ranit; PMS-Ranitidine; Ranitidine Injection, USP; Ratio-Ranitidine; Rhoxal-Ranitidine; Riva-Ranitidine; Sandoz-Ranitidine; ScheinPharm Ranitidine; Zantac 75®; Zantac Maximum Strength Non-Prescription; Zantac®

Pharmacologic CategoryHistamine H_2 Antagonist

Use: Labeled Indications

Zantac®: Short-term and maintenance therapy of duodenal ulcer, gastric ulcer, gastroesophageal reflux, active benign ulcer, erosive esophagitis, and pathological hypersecretory conditions; as part of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence

Zantac 75® [OTC]: Relief of heartburn, acid indigestion, and sour stomach

Use: Unlabeled/InvestigationalRecurrent postoperative ulcer, upper GI bleeding, prevention of acid-aspiration pneumonitis during surgery, and prevention of stress-induced ulcers

Dosing: Adults

Duodenal ulcer: Oral: Treatment: 150 mg twice daily, or 300 mg once daily after the evening meal or at bedtime; maintenance: 150 mg once daily at bedtime

Eradication of*Helicobacter pylori*: Oral: 150 mg twice daily; requires combination therapy

Pathological hypersecretory conditions:

Oral: 150 mg twice daily; adjust dose or frequency as clinically indicated; doses of up to 6 g/day have been used

I.V.: Continuous infusion for Zollinger-Ellison: 1 mg/kg/hour; measure gastric acid output at 4 hours, if >10 mEq or if patient is symptomatic, increase dose in increments of 0.5 mg/kg/hour; doses of up to 2.5 mg/kg/hour have been used

Gastric ulcer, benign:*Oral:* 150 mg twice daily; maintenance: 150 mg once daily at bedtime

Erosive esophagitis: *Oral:* Treatment: 150 mg 4 times/day; maintenance: 150 mg twice daily

Prevention of heartburn:*Oral:* Zantac 75® [OTC]: 75 mg 30-60 minutes before eating food or drinking beverages which cause heartburn; maximum: 150 mg in 24 hours; do not use for more than 14 days

Patients not able to take oral medication:

I.M.: 50 mg every 6-8 hours

I.V.: Intermittent bolus or infusion: 50 mg every 6-8 hours

Continuous I.V. infusion: 6.25 mg/hour

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Duodenal and gastric ulcer:

Oral: Children 1 month to 16 years:

Treatment: 2-4 mg/kg/day divided twice daily; maximum treatment dose: 300 mg/day

Maintenance: 2-4 mg/kg once daily; maximum maintenance dose: 150 mg/day

I.V.: 2-4 mg/kg/day divided every 6-8 hours; maximum: 200 mg/day

GERD and erosive esophagitis: Children 1 month to 16 years:

Oral: 5-10 mg/kg/day divided twice daily; maximum: GERD: 300 mg/day, erosive esophagitis: 600 mg/day

I.V. (unlabeled): 2-4 mg/kg/day divided every 6-8 hours; maximum: 200 mg/day **or as an alternative**

Continuous infusion: Initial: 1 mg/kg/dose for one dose followed by infusion of 0.08-0.17 mg/kg/hour or 2-4 mg/kg/day

Prevention of heartburn:*Oral:* Children ≥12 years: Zantac 75® [OTC]: 75 mg 30-60 minutes before eating food or drinking beverages which cause heartburn; maximum: 150 mg/24 hours; do not use for more than 14 days

Dosing: Renal ImpairmentAdults: Cl_{cr} <50 mL/minute:

Oral: 150 mg every 24 hours; adjust dose cautiously if needed

I.V.: 50 mg every 18-24 hours; adjust dose cautiously if needed

Hemodialysis: Adjust dosing schedule so that dose coincides with the end of hemodialysis.

Dosing: Hepatic ImpairmentPatients with hepatic impairment may have minor changes in ranitidine half-life, distribution, clearance, and bioavailability; dosing adjustments are not necessary; monitor patient.

Calculations

- Creatinine Clearance: Adults

Administration: I.M.No dilution is needed

Administration: I.V.

Intermittent bolus: Dilute vials to 2.5 mg/mL; infuse at 4 mL/minute (5 minutes)

Intermittent infusion: Dilute vials to 0.5 mg/mL; infuse at 5-7 mL/minute (15-20 minutes)

Continuous I.V. infusion: Administer at 6.25 mg/hour and titrate dosage based on gastric pH by continuous infusion over 24 hours

Administration: I.V. DetailI.V. must be diluted and may be administered IVP or IVPB or continuous I.V. infusion.

pH: 6.7-7.3

Administration: OralEFFERdose®: Should not be chewed, swallowed whole, or dissolved on tongue: 25 mg tablet: Dissolve in at least 5 mL (1 teaspoonful) of water; wait until completely dissolved before administering

Dietary ConsiderationsOral dosage forms may be taken with or without food.

Zantac® EFFERdose®: Effervescent tablet 25 mg contains sodium 1.33 mEq/tablet and phenylalanine 2.81 mg/tablet

Storage

Injection: Vials: Store between 4°C to 30°C (39°F to 86°F). Protect from light. Solution is a clear, colorless to yellow solution; slight darkening does not affect potency. Vials mixed with NS or D_5W are stable for 48 hours at room temperature.

Premixed bag: Store between 2°C to 25°C (36°F to 77°F). Protect from light.

EFFERdose® formulations: Store between 2°C to 30°C (36°F to 86°F).

Syrup: Store between 4°C to 25°C (39°F to 77°F). Protect from light.

Tablets: Store in dry place, between 15°C to 30°C (59°F to 86°F). Protect from light.

ReconstitutionVials can be mixed with NS or D_5W.

Intermittent bolus injection: Dilute to maximum of 2.5 mg/mL.

Intermittent infusion: Dilute to maximum of 0.5 mg/mL.

Compatibility

Stable in $D_5{}^1/_2NS$, D_5W, $D_{10}W$, fat emulsion 10%, LR, NS, sodium bicarbonate 5%; for injection, do not add other medications to premixed bag; **variable compatibility (consult detailed reference)** in D_5LR, TPN.

Y-site administration: Compatible: Acyclovir, aldesleukin, allopurinol, amifostine, aminophylline, amsacrine, atracurium, aztreonam, bretylium, cefazolin, cefepime, cefoperazone, cefoxitin, ceftazidime, ceftizoxime, ciprofloxacin, cisatracurium, cisplatin, cladribine, clarithromycin, cyclophosphamide, cytarabine, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, enalaprilat, epinephrine, esmolol, etoposide, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, furosemide, gatifloxacin, gemcitabine, granisetron, heparin, hydromorphone, idarubicin, labetalol, linezolid, lorazepam, melphalan, meperidine, methotrexate, midazolam, milrinone, morphine, nicardipine, nitroglycerin, norepinephrine, ondansetron, ondansetron with paclitaxel, paclitaxel, pancuronium, piperacillin, piperacillin/tazobactam, procainamide, propofol, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, vecuronium, vinorelbine, warfarin, zidovudine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, hetastarch, insulin (regular). **Variable (consult detailed reference):** TPN.

Compatibility in syringe: Compatible: Atropine, cyclizine, dexamethasone sodium phosphate, dimenhydrinate, diphenhydramine, dobutamine, dopamine, fentanyl, glycopyrrolate, hydromorphone, isoproterenol, meperidine, metoclopramide, morphine, nalbuphine, oxymorphone, pentazocine, perphenazine, prochlorperazine edisylate, promethazine, scopolamine, thiethylperazine. **Incompatible:** Hydroxyzine, methotrimeprazine, midazolam, pentobarbital, phenobarbital. **Variable (consult detailed reference):** Chlorpromazine, diazepam, lorazepam.

Compatibility when admixed: Compatible: Acetazolamide, amikacin, aminophylline, ampicillin, chloramphenicol, chlorothiazide, ciprofloxacin, colistimethate, dexamethasone sodium phosphate, digoxin, dobutamine, dopamine, doxycycline, epinephrine, erythromycin lactobionate, floxacillin, fluconazole with ondansetron, flumazenil, furosemide, gentamicin, heparin, isoproterenol, lidocaine, lincomycin, meropenem, methylprednisolone sodium succinate, penicillin G potassium, penicillin G sodium, polymyxin B sulfate, potassium chloride, protamine, quinidine gluconate, sodium nitroprusside, ticarcillin, tobramycin, vancomycin. **Incompatible:** Amphotericin B, atracurium, cefamandole, cefazolin, cefoxitin, ceftazidime, cefuroxime, ethacrynate, metaraminol, phytonadione. **Variable (consult detailed reference):** Clindamycin, insulin (regular), norepinephrine.

ContraindicationsHypersensitivity to ranitidine or any component of the formulation

Allergy Considerations

- Histamine H_2 Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- B_{12} deficiency: Long-term therapy may be associated with vitamin B_{12} deficiency.
- Confusion: Reversible confusional states (rare), usually clearing within 3-4 days after discontinuation, have been linked to use. Increased age (>50 years) and renal or hepatic impairment are thought to be associated.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Porphyria: Avoid use in patients with a history of acute porphyria; may precipitate attacks.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in infants <1 month of age.

Dosage form specific issues:

- Phenylalanine: EFFERdose® formulation contains phenylalanine.

Geriatric ConsiderationsUlcer healing rates and incidence of adverse effects are similar in the elderly, when compared to younger patients; dosing adjustments not necessary based on age alone. Always adjust dose based upon creatinine clearance. Serum half-life is increased to 3-4 hours in elderly patients. H_2 blockers are the preferred drugs for treating PUD in the elderly due to cost and ease of administration. These agents are no less or more effective than any other therapy. The preferred agents, due to side effects and drug interaction profile and pharmacokinetics are ranitidine, famotidine, and nizatidine. Treatment for PUD in the elderly is recommended for 12 weeks since their lesions are larger; therefore, take longer to heal. This drug is substantially cleared renally, and elderly, having decreased renal function in general, should be monitored closely for adverse effects, especially CNS.

Pregnancy Risk FactorB

Pregnancy ConsiderationsRanitidine crosses the placenta, teratogenic effects to the fetus have not been reported in animal studies. Use with caution during pregnancy.

LactationEnters breast milk/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Atrioventricular block, bradycardia, premature ventricular beats, tachycardia, vasculitis

Central nervous system: Agitation, dizziness, depression, hallucinations, headache, insomnia, malaise, mental confusion, somnolence, vertigo

Dermatologic: Alopecia, erythema multiforme, rash

Endocrine & metabolic: Increased prolactin levels

Gastrointestinal: Abdominal discomfort/pain, constipation, diarrhea, nausea, pancreatitis, vomiting

Hematologic: Acquired hemolytic anemia, agranulocytosis, aplastic anemia, granulocytopenia, leukopenia, pancytopenia, thrombocytopenia

Hepatic: Hepatic failure, hepatitis

Local: Transient pain, burning or itching at the injection site

Neuromuscular & skeletal: Arthralgia, involuntary motor disturbance, myalgia

Ocular: Blurred vision

Renal: Serum creatinine increased

Respiratory: Pneumonia (causal relationship not established)

Miscellaneous: Anaphylaxis, angioneurotic edema, hypersensitivity reactions

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2C19, 2D6; **Inhibits** CYP1A2 (weak), 2D6 (weak)
Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): H2-Antagonists may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole; Voriconazole. *Risk D: Consider therapy modification*

Atazanavir: H2-Antagonists may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Cefpodoxime: H2-Antagonists may decrease the absorption of Cefpodoxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Cefuroxime: H2-Antagonists may decrease the absorption of Cefuroxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Dasatinib: H2-Antagonists may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Erlotinib: H2-Antagonists may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Fosamprenavir: H2-Antagonists may decrease the serum concentration of Fosamprenavir. Cimetidine may also inhibit the metabolism of the active metabolite amprenavir, making its effects on fosamprenavir/amprenavir concentrations difficult to predict. *Risk C: Monitor therapy*

Indinavir: H2-Antagonists may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: H2-Antagonists may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Mesalamine: H2-Antagonists may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; H2-antagonists would be expected to interact in a similar manner. *Risk X: Avoid combination*

Nelfinavir: H2-Antagonists may decrease the serum concentration of Nelfinavir. Concentrations of the active M8 metabolite may also be reduced. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Saquinavir: H2-Antagonists may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause gastric mucosal irritation).

Food: Does not interfere with absorption of ranitidine.

Test InteractionsFalse-positive urine protein using Multistix®, gastric acid secretion test, skin test allergen extracts, serum creatinine, urine protein test
Monitoring ParametersAST, ALT, serum creatinine; when used to prevent stress-related GI bleeding, measure the intragastric pH and try to maintain pH >4; signs and symptoms of peptic ulcer disease, occult blood with GI bleeding, monitor renal function to correct dose; monitor for side effects
Nursing: Physical Assessment/MonitoringUse caution in presence of renal or hepatic impairment. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased or decreased levels/effects and toxicity). Evaluate results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, bradycardia, PVCs, tachycardia, CNS changes [depression, hallucinations, confusion, malaise], rash, gynecomastia, GI disturbance, hepatic failure). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsAST, ALT, serum creatinine; when used to prevent stress-related GI bleeding, measure the intragastric pH and try to maintain pH >4; occult blood with GI bleeding; monitor renal function and adjust dosage as indicated.
Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed; do not increase dose - may take several days before you notice relief. Allow 1 hour between any other antacids (if approved by prescriber) and ranitidine. Avoid excessive alcohol. Follow diet as prescriber recommends. May cause drowsiness, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report chest pain or irregular heartbeat; skin rash; CNS changes (mental confusion, hallucinations, somnolence); unusual persistent weakness or lethargy; yellowing of skin or eyes; or change in color of urine or stool. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule 150 mg, 300 mg

Infusion [premixed in NaCl 0.45%; preservative free]:

Zantac®: 50 mg (50 mL)

Injection, solution: 25 mg/mL (2 mL, 6 mL)

Zantac®: 25 mg/mL (2 mL, 6 mL, 40 mL) [contains phenol 0.5% as preservative]

Syrup: 15 mg/mL (5 mL, 10 mL, 473 mL)

Zantac®: 15 mg/mL (473 mL) [contains alcohol 7.5%; peppermint flavor]

Tablet: 75 mg [OTC], 150 mg, 300 mg

Zantac®: 150 mg, 300 mg

Zantac 75®: 75 mg

Zantac 150™: 150 mg

Tablet, for solution, oral [effervescent]:

Zantac® EFFERdose®: 25 mg [contains phenylalanine 2.81 mg/tablet, sodium 1.33 mEq/tablet, sodium benzoate]

Generic AvailableYes: Excludes effervescent tablet

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Capsules (Ranitidine HCl)

150 mg (60): $35.99

300 mg (30): $30.99

Syrup (Zantac)

15 mg/mL (300): $224.88

Tablets (Ranitidine HCl)

150 mg (90): $17.99

300 mg (30): $14.99

Tablets (Zantac)

150 mg (60): $225.43

300 mg (30): $207.93

Tablets (Zantac 75)

75 mg (4): $8.99

75 mg (10): $7.99

75 mg (20): $7.99

75 mg (30): $17.99

75 mg (60): $20.99

Mechanism of ActionCompetitive inhibition of histamine at H_2-receptors of the gastric parietal cells, which inhibits gastric acid secretion, gastric volume, and hydrogen ion concentration are reduced. Does not affect pepsin secretion, pentagastrin-stimulated intrinsic factor secretion, or serum gastrin.

Pharmacodynamics/Kinetics

Absorption: Oral: 50%

Distribution: Normal renal function: V_d: 1.7 L/kg; Cl_{cr} 25-35 mL/minute: 1.76 L/kg minimally penetrates the blood-brain barrier; enters breast milk

Protein binding: 15%

Metabolism: Hepatic to N-oxide, S-oxide, and N-desmethyl metabolites

Bioavailability: Oral: 48%

Half-life elimination:

Oral: Normal renal function: 2.5-3 hours; Cl_{cr} 25-35 mL/minute: 4.8 hours

I.V.: Normal renal function: 2-2.5 hours

Time to peak, serum: Oral: 2-3 hours; I.M.: ≤15 minutes

Excretion: Urine: Oral: 30%, I.V.: 70% (as unchanged drug); feces (as metabolites)

Related Information

- Antacid Drug Interactions

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; concurrent use with diazepam may reduce diazepam's effectiveness

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Ranitidine causes fewer CNS adverse reactions and drug interactions compared to cimetidine.

Evidence-Based Information: The 2008 Surviving Sepsis Campaign guidelines recommend that stress ulcer prophylaxis using an H_2 blocker (Grade 1A) or proton pump inhibitor (Grade 1B) be given to patients with severe sepsis to prevent upper GI bleed. Benefit of prevention of upper GI bleed must be weighed against potential effect of increased stomach pH on development of ventilator-associated pneumonia.

Index TermsRanitidine Hydrochloride

Ranolazine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ranexa™ may be confused with Celexa®

Pronunciation(ra NOE la zeen)
U.S. Brand NamesRanexa®
Pharmacologic CategoryCardiovascular Agent, Miscellaneous
Use: Labeled IndicationsTreatment of chronic angina
Dosing: Adults

Chronic angina: Oral: Initial: 500 mg twice daily; maximum recommended dose: 1000 mg twice daily

Dosage adjustment for ranolazine with concomitant medications:

Diltiazem, verapamil, and other moderate CYP3A inhibitors: Dose should not exceed 500 mg twice daily

P-glycoprotein inhibitors (eg, cyclosporine): Down-titrate ranolazine based on clinical response

Dosing: ElderlyRefer to adult dosing. Select dose cautiously, starting at the lower end of the dosing range.
Dosing: Renal ImpairmentDosage adjustment recommendations have not been established. However, plasma ranolazine levels increased ~50% in patients with varying degrees of renal dysfunction. Patients with severe renal dysfunction had an increase in mean diastolic blood pressure of 10-15 mm Hg. Monitor blood pressure closely in these patients. Ranolazine has not been evaluated in patients requiring dialysis.
Dosing: Hepatic ImpairmentUse with caution in patients with mild (Child-Pugh class A) and moderate (Child-Pugh class B) hepatic impairment. Use is contraindicated with clinically significant hepatic impairment.
Administration: OralMay be taken with or without meals. Swallow tablet whole; do not crush, break, or chew.
Dietary ConsiderationsMay be taken with or without food.
StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
ContraindicationsClinically significant hepatic impairment; concurrent strong CYP3A inhibitors; concurrent inducers of CYP3A
Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Has been shown to prolong QT interval in a dose/plasma concentration-related manner. Hepatically-impaired patients may have a more significant increase in QT interval. The incidence of symptomatic arrhythmias was similar to placebo in one trial (Morrow, 2007).

Disease-related concerns:

- Acute angina: Ranolazine does not relieve acute angina attacks.

- Hepatic impairment: Ranolazine plasma levels increase by 30% in patients with mild (Child-Pugh class A) and by 60% in patients with moderate (Child-Pugh class B) hepatic impairment. Use is contraindicated with clinically significant hepatic impairment.

- Renal impairment: Use with caution in patients with renal dysfunction; plasma levels may increase by 50%. With severe impairment, an elevation in diastolic blood pressure (15 mm Hg) may be observed. Monitor blood pressure in patients with renal dysfunction. Ranolazine has not been evaluated in patients requiring dialysis.

Concurrent drug therapy issues:

- High potential for interactions: Ranolazine is primarily metabolized by CYP3A; use is contraindicated with inducers and strong inhibitors of CYP3A.

- P-glycoprotein inhibitors/substrates: Ranolazine is a substrate for and a moderate inhibitor of P-glycoprotein. Inhibitors of P-glycoprotein may increase serum concentrations of ranolazine. Ranolazine may increase serum concentrations of substrates for P-glycoprotein (eg, digoxin).

- QT-prolonging drugs: Ranolazine has potential to prolong the QT interval; use caution when administered concomitantly with QT-prolonging drugs.

Special populations:

- Elderly: Use with caution in patients ≥75 years of age; they may experience more adverse events (eg, constipation, dizziness, nausea) than younger patients.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Tumorigenesis: In APC$^{(Min/+)}$ mice, an established model of spontaneous intestinal tumorigenesis, ranolazine was shown to have a dose-dependent increase in the number of intestinal tumors. Clinical significance of this effect in humans is unknown. However, use caution when administering ranolazine to patients with a history of malignant neoplasms or adenomatous polyps.

Geriatric ConsiderationsElderly comprised 48% of study group participants. For those elderly, no overall difference in efficacy was observed between younger and older adults. There was, however, a higher incidence of adverse effects for those ≥75 years of age, resulting in drug discontinuations. The most common adverse effects were constipation (19%), nausea (6%), and dizziness (6%). Therefore, start dosing at lower end of dosing range recommended.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse effects were observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Central nervous system: Dizziness (5% to 13%; dose related)

Gastrointestinal: Constipation (5% to 8%; 19% in the elderly)

>0.5% to 10%:

Cardiovascular: Syncope (≤3%), bradycardia (≤2%), hypotension (≤2%), orthostatic hypotension (≤2%), palpitation (≤2%), peripheral edema (≤2%), QT$_c$ prolongation (>500 msec: ≤1%)

Central nervous system: Headache (3% to 6%), vertigo (≤2%)

Gastrointestinal: Nausea (4% to 9%), abdominal pain (≤2%), vomiting (≤2%), xerostomia (≤2%)

Hematologic: Hematocrit decreased (1%)

Otic: Tinnitus (≤2%)

Respiratory: Dyspnea (≤2%)

≤0.5%: Angioedema, blood pressure increased, blurred vision, confusion, eosinophilia, hemoglobin A$_{1c}$ decreased, hematuria, hypoesthesia, leukopenia, pancytopenia, paresthesia, pulmonary fibrosis, renal failure, serum creatinine increased, thrombocytopenia, T-wave amplitude decreased, T-wave changes (notched), torsade de pointes (case report [Morrow, 2007]), tremor, weakness

Metabolism/Transport Effects**Substrate** of CYP3A4 (major), 2D6 (minor), P-glycoprotein; **Inhibits** CYP3A4 (weak), 2D6 (moderate), P-glycoprotein

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

CYP3A4 Inhibitors (Moderate): May increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Digoxin: Ranolazine may increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Simvastatin: Ranolazine may increase the serum concentration of Simvastatin. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Limit the use of grapefruit, grapefruit juice, or grapefruit-containing products; if use is significant and consistent, the dose of ranolazine should be limited to 500 mg twice daily.

Monitoring ParametersBaseline and follow up ECG to evaluate QT interval; blood pressure in patients with renal dysfunction; correct and maintain serum potassium in normal limits

Nursing: Physical Assessment/MonitoringAssess other prescription and OTC medications patient may be taking to avoid duplications and interactions. Stress that this medication is not intended to treat an acute angina episode. Instruct them in appropriate measures to take if an acute episode occurs. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsBaseline and follow up ECG to evaluate QT interval; correct and maintain serum potassium in normal limits

Patient EducationThis medication is not intended to be used to treat an acute angina episode. Follow instructions provided by prescriber for acute management. Swallow tablets whole; do not crush, break, or chew the tablets. Avoid grapefruit juice or grapefruit products while taking this medication. You may experience dizziness, lightheadedness (use caution when driving or engaging in activities requiring alertness until response to drug is known), or constipation (increasing exercise, fluids, fruit/fiber may help). Report palpitations, fainting spells, or chest pain that does not respond to recommended interventions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, extended release:

Ranexa®: 500 mg, 1000 mg

Generic AvailableNo

ManufacturerCV Therapeutics

Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (Ranexa)

500 mg (60): $211.49

1000 mg (60): $325.54

Mechanism of ActionRanolazine exerts antianginal and anti-ischemic effects without changing hemodynamic parameters (heart rate or blood pressure). At therapeutic levels, ranolazine inhibits the late phase of the inward sodium channel (late I_{Na}) in ischemic cardiac myocytes during cardiac repolarization reducing intracellular sodium concentrations and thereby reducing calcium influx via Na^+-Ca^{2+} exchange. Decreased intracellular calcium reduces ventricular tension and myocardial oxygen consumption. It is thought that ranolazine produces myocardial relaxation and reduces anginal symptoms through this mechanism although this is uncertain. At higher concentrations, ranolazine inhibits the rapid delayed rectifier potassium current (I_{Kr}) thus prolonging the ventricular action potential duration and subsequent prolongation of the QT interval.

Pharmacodynamics/Kinetics

Absorption: Highly variable; ranolazine is a substrate of P-glycoprotein; concurrent use of P-glycoprotein inhibitors may increase absorption

Protein binding: ~62%

Metabolism: Hepatic via CYP3A (major) and 2D6 (minor); gut

Bioavailability: 35% to 55%

Half-life elimination: Terminal: 7 hours

Time to peak, plasma: 2-5 hours

Excretion: Primarily urine (75% mostly as metabolites); feces (25% mostly as metabolites); in feces and urine, <5% to 7% excreted unchanged

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsRanolazine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentContraindicated with QT_c-prolonging agents including amitriptyline, chlorpromazine, domperidone, droperidol, fluoxetine, flupenthixol, haloperidol, imipramine, loxapine, mesoridazine, pimozide, quetiapine, thioridazine, thiothixene, ziprasidone, and zuclopenthixol. Also contraindicated with strong or moderate CYP3A4 inhibitors such as nefazodone. Carbamazepine may reduce the levels and/or effects of ranolazine.

Cardiovascular Considerations

The relationship between the change in corrected QT and ranolazine plasma concentration is linear with a slope of ~2.6 msec per 1000 ng/mL ranolazine. At T_{max} following repeat dosing at 1000 mg twice daily, the mean change in QT_c is ~6 msec, but 5% of the population (with the highest plasma concentrations) has at least a 15 msec increase. Avoid concurrent use of drugs with QT_c-prolonging potential and drugs that inhibit ranolazine metabolism (CYP3A4 inhibitors).

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Azilect® may be confused with Aricept®

Pronunciation(ra SA ji leen)

U.S. Brand NamesAzilect®

Pharmacologic CategoryAnti-Parkinson's Agent, MAO Type B Inhibitor

Use: Labeled IndicationsInitial monotherapy or as adjunct to levodopa in the treatment of idiopathic Parkinson's disease

Dosing: Adults**Parkinson's disease:** Oral:

Monotherapy: 1 mg once daily

Adjunctive therapy with levodopa: Initial: 0.5 mg once daily; may increase to 1 mg once daily based on response and tolerability

Note: When added to existing levodopa therapy, a dose reduction of levodopa may be required to avoid exacerbation of dyskinesias; typical dose reductions of ~9% to 13% were employed in clinical trials.

Dose reduction with concomitant ciprofloxacin or other CYP1A2 inhibitors: 0.5 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild impairment: No adjustment necessary.

Moderate-to-severe impairment: No data available.

Dosing: Hepatic Impairment

Mild impairment (Child-Pugh ≤6): 0.5 mg once daily

Moderate-to-severe impairment: Not recommended.

Dietary ConsiderationsAvoid tyramine-containing foods/beverages. Some examples include aged or matured cheese, air-dried or cured meats (including sausages and salamis), fava or broad bean pods, tap/draft beers, Marmite concentrate, sauerkraut, soy sauce and other soybean condiments.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to rasagiline or any component of the formulation; concomitant use of amphetamine, tramadol, propoxyphene, methadone, dextromethorphan, St John's wort, mirtazapine, cyclobenzaprine, or sympathomimetic amines (eg, pseudoephedrine, ephedrine); use of meperidine or other MAO inhibitor within 14 days of rasagiline; elective surgery requiring general anesthesia, local anesthesia containing sympathomimetic vasoconstrictors; patients with pheochromocytoma

Allergy Considerations

- Rasagiline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause hallucinations; signs of severe CNS toxicity (some fatal), including hyperpyrexia, hyperthermia, rigidity, altered mental status, seizure and coma have been reported in combination with antidepressants.
- Melanoma: Risk of melanoma may be increased with rasagiline, although increased risk has been associated with Parkinson's disease itself; patients should have regular and frequent skin examinations.
- Orthostatic hypotension: May cause orthostatic hypotension, particularly in combination with levodopa; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with mild hepatic impairment; dose reduction recommended. Avoid with moderate to severe impairment.

Concurrent drug therapy issues:

- Antidepressants: Use of rasagiline with tricyclic antidepressants and SSRIs has also been associated with rare reactions and should generally be avoided. Do not use within 5 weeks of fluoxetine discontinuation; do not initiate tricyclic, SSRI or SNRI therapy within 2 weeks of discontinuing rasagiline.

- Levodopa: Addition of oral selegiline to levodopa therapy may result in exacerbation of levodopa adverse effects, requiring a reduction in levodopa dosage.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Elective surgery: Due to the potential for hemodynamic instability, patients should not undergo elective surgery requiring general anesthesia and should avoid local anesthesia containing sympathomimetic vasoconstrictors within 14 days of discontinuing rasagiline. If surgery is required, benzodiazepines, mivacurium, fentanyl, morphine or codeine may be used cautiously.

- Tyramine-containing products: Use caution with foods high in tyramine content, supplements containing tyrosine, phenylalanine, tryptophan, or caffeine; hypertensive crisis may occur; avoid for at least 2 weeks following discontinuation of rasagiline.

Geriatric ConsiderationsIn clinical trials, no significant differences in the safety profile were seen between elderly and younger adults.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have documented decreased offspring survival and birth weight. An increased incidence of teratogenic effects, embryo-fetal deaths, and cardiovascular abnormalities were also noted with rasagiline in combination with levodopa/carbidopa. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsAnimal studies have shown rasagiline is capable of inhibiting prolactin secretion.
Adverse ReactionsUnless otherwise noted, the following adverse reactions are as reported for monotherapy. Spectrum of adverse events was generally similar with adjunctive (levodopa) therapy, though the incidence tended to be higher.

>10%:

Central nervous system: Dyskinesia (18% adjunct therapy), headache (14%)

Gastrointestinal: Nausea (10% to 12% adjunct therapy)

1% to 10%:

Cardiovascular: Postural hypotension (6% to 9% adjunct therapy; dose dependent), bundle branch block angina, chest pain, syncope

Central nervous system: Depression (5%), hallucinations (4% to 5% adjunct therapy), fever (3%), malaise (2%), vertigo (2%), anxiety, dizziness

Dermatologic: Bruising (2%), alopecia, skin carcinoma, vesiculobullous rash

Endocrine & metabolic: Impotence, libido decreased

Gastrointestinal: Constipation (4% to 9% adjunct therapy), weight loss (2% to 9% adjunct therapy; dose dependent), dyspepsia (7%), xerostomia (2% to 6% adjunct therapy; dose dependent), gastroenteritis (3%), anorexia, diarrhea, gastrointestinal hemorrhage, vomiting

Genitourinary: Hematuria, urinary incontinence

Hematologic: Leukopenia

Hepatic: Liver function tests increased

Neuromuscular & skeletal: Arthralgia (7%), neck pain (2%), arthritis (2%), paresthesia (2%), abnormal gait, hyperkinesias, hypertonia, neuropathy, tremor, weakness

Ocular: Conjunctivitis (3%)

Renal: Albuminuria

Respiratory: Rhinitis (3%), asthma, cough increased

Miscellaneous: Fall (5%), flu-like syndrome (5%), allergic reaction

<1% (Limited to important or life-threatening): Acute kidney failure, aphasia, apnea, atrial arrhythmia, bigeminy, blepharitis, blindness, bone necrosis, cerebral hemorrhage, cerebral ischemia, circumoral paresthesia, deafness, deep thrombophlebitis, delirium, diplopia, dysautonomia, dysesthesia, emphysema, esophageal ulcer, exfoliative dermatitis, facial paralysis, glaucoma, gynecomastia, heart failure, hematemesis, hemiplegia, hemorrhage (various locations), hostility, hypocalcemia, incoordination, interstitial pneumonia, intestinal obstruction, intestinal perforation, intestinal stenosis, jaundice, keratitis, kidney calculus, large intestine perforation, laryngismus, larynx edema, leukoderma, leukorrhea, lung fibrosis, macrocytic anemia, manic depressive reaction, mania, megacolon, menstrual abnormalities, MI, muscle atrophy, myelitis, neuralgia, neuritis, neurosis, nocturia, paranoid reaction, parosmia, personality disorder, pleural effusion, pneumothorax, polyuria, psychosis, psychotic depression, ptosis, purpura, retinal degeneration, retinal detachment, seizure, stomach ulcer, strabismus, stupor, thrombocythemia, thrombosis, tongue edema, urinary disorders, vaginal moniliasis, ventricular fibrillation, ventricular tachycardia, vestibular disorder, visual field defect

Metabolism/Transport Effects**Substrate** of CYP1A2 (major)
Drug Interactions

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Linezolid: MAO Inhibitors may enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Lithium: MAO Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*
